Rossi for You

Innovation

Rossi S.p.A. offers a wide range of solutions for an evolving industry, flexible and innovative gear reducers and gearmotors for customer tailored solutions to maximize performances and minimize the Total Cost of Ownership (TCO).

High quality, 3 years warranty

Our drive is to innovate and boost operations by manufacturing performing, precise, reliable and high-quality products all over the world. We are always one step forward in offering and developing solutions that can satisfy an unlimited number of application needs, even in the most demanding conditions.

Reliability

We are a reliable company with the right flexibility and know-how to respond to worldwide market requests, in all application fields, without leaving aside our commitment for the environment and value on human safety, to protect everyone's future.

Tools and processes

We continue to invest in new tools and processes, so our highly skilled specialist team in different fields are supporting you to find the best solution suitable for your demands, always by your side on every step of the project.

After-sale service

Highly trained mechanics and support teams can ensure a fast and efficient after-sale service providing support worldwide.

Digital support

Alongside our 24/7 Rossi for You portal you have a suite of digital support tools enabling real time access to your order tracking, invoices, spare part tables download and contact to our service.

Experience

70 YEARS

Shaped by 70 years of history Rossi meets your unique needs whether you need a standard design or a customized solution.

ROSSI

1.1

Global presence local service

Local support
Sales, customer service,
technical support, spare parts

15 branches*

Worldwide distribution network *

A global network of subsidiaries and dealers.
From design and execution to after sales service.
Rossi S.p.A. is always close to you, a local reliable and flexible partner.

Alongside our 24/7 **Rossi for You** portal you have a suite of digital support tools enabling real time access to your order tracking, invoices, spare part tables download and contact to our service.

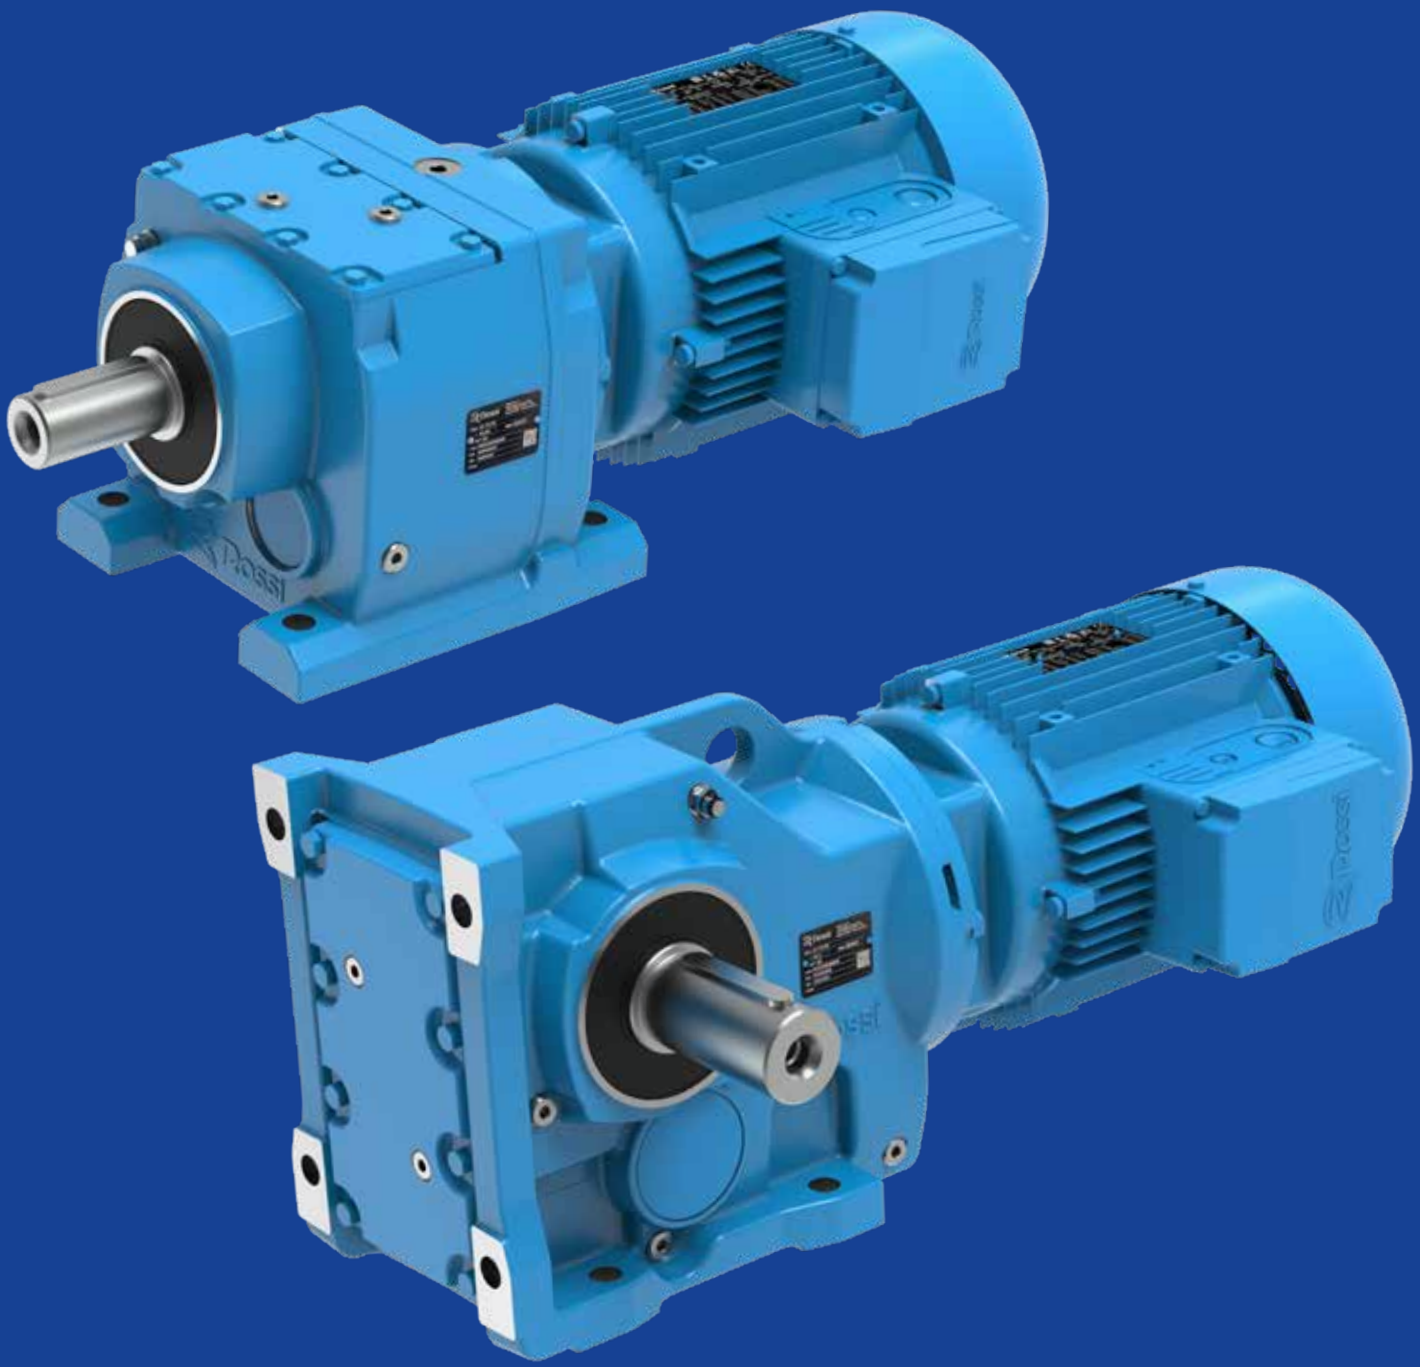
Product Overview

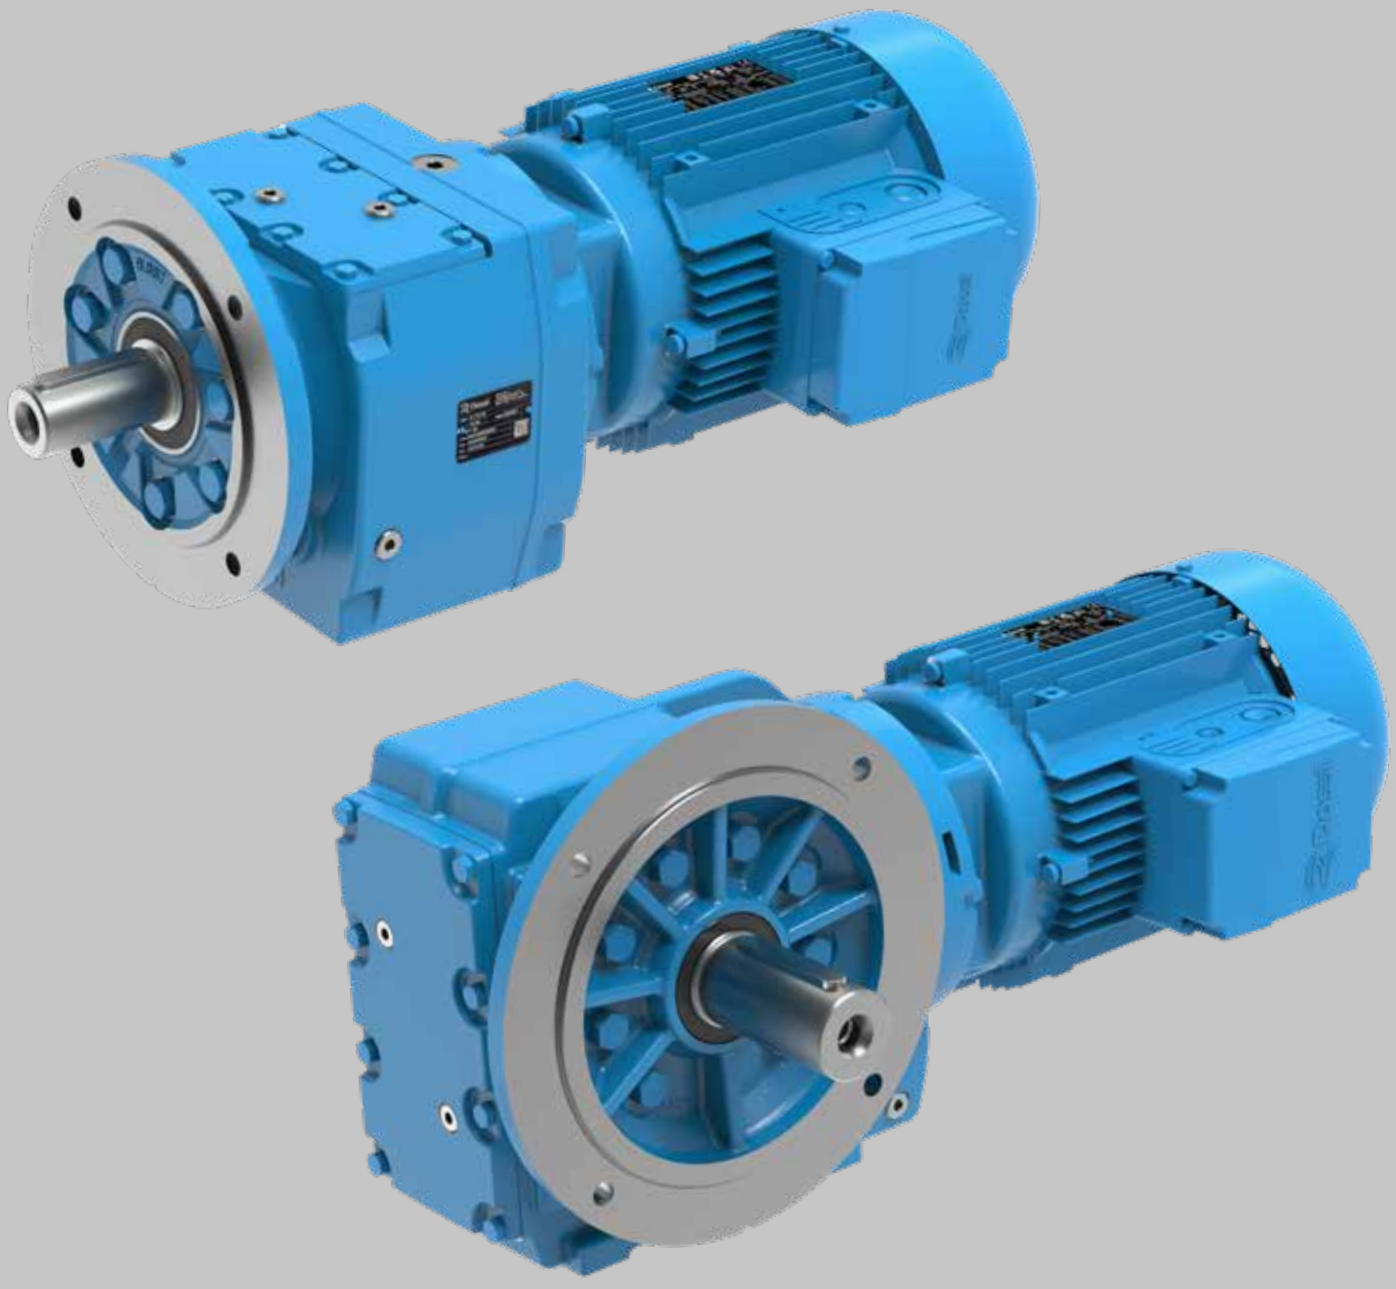


Section contents

2.1	Features & Benefits	12
2.2	Electric motors	14
2.3	Inverter	15
2.4	Product Range	16

2.1

Features & Benefits



Fully interchangeable

Plug&Play.
No re-engineering costs.

100% made in EU

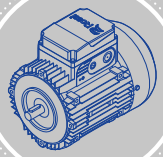
Superior quality,
minimum maintenance

Cast iron housing

Maximum performance and reliability

Gear precision DIN/ISO 6

Energy saving, low noise level, reduced backlash



IE3 electric motors

Premium efficiency

High quality

Long life lubrication. Dedicated motor side sealing system

Compact design

Wash down capability thanks to round shaped, smooth housing surface

High performance

Up to 12% higher than market standard

Additional benefits

- High Customer Value
- Short Lead Times for standard products
- 3 Years Guarantee

2.2

Electric motors

- Standard and brake motors
- IE3 class of the international efficiency standard (IEC 60034-30) ⩾ 0,75 kW
- IE2 class of the international efficiency standard (IEC 60034-30) ⩽ 0,55 kW
- Multivoltage, 2, 4 and 6 poles
- Aluminium frame
- Cable entry possible from two sides
- Motor insulation class F, rise temperature B

COMPLIANCE

- Test documents
- c UL us motors certified to UL
- Machinery Directive 2006/42/EC
- Directive 2011/65/EC RoHS
- Directive «ErP» 2009/125/EC

PROTECTION/PAINTING

- Blue RAL 5010 paint with corrosivity class C3 as standard (hard and smooth clinging painting)
- IP 55

OPTIONS

- Motor insulation class H
- Bi-metal type thermal probes
- Thermistor type (PTC) thermal probes
- Motor with connectors
- Anti-condensation heater
- Forced fan cooling (IC 416)
- Drip-proof cover
- Double shaft extension
- Incremental encoder sin/cos
- Optional painting
- Optional protection grades IP 56 ... IP 66

2.3

Inverter

- Max overloads: up to 200%
- Best sensor-less ability to handle overloads
- Flexibility in motor-mounted or wall-mounted installation
- Full "Plug & Play"
- Autotuning, software programming and updating included
- In compliance with IE2 class ECODESIGN EN 50598 IEC/EN 60034-30-1 and Ecodesign Directive in accordance with IEC 61800-9-2
- Remote commissioning, monitoring and diagnostics, Bluetooth, App and Safety (STO)
- Communication and connection among several inverters
- A wide range of Field buses
- Comprehensive options range, components and design concept guarantee the best reliability and vibration resistance. Dust-tight and protected against water jets (IP 65).

4.1

General specifications

Helical inline gearmotors - iC

		iC 27...	iC 37...	iC 47...	iC 57...	iC 67...	iC 77...	iC 87...	iC 97...
Low speed solid shaft diameter	[mm]	25	25	30	35	35	40	50	60
Shaft height (design PE)	[mm]	90	90	115	115	130	140	180	225
B5 flange diameter (design FE)	[mm]	120...160	120...200	140...200	160...250	200, 250	250, 300	300, 350	350, 450
Maximum nominal torque	[N m]	145	224	335	500	670	925	1750	3350
Maximum nominal radial load	[N]	4230	4940	5420	7100	6980	9900	16900	19800

- **Maximum interchangeability** (shaft height, low speed shaft end, foot dimensions and fitting holes, designs), and performance equal or higher than market standards;
- **IE3, IE2 efficiency motors**;
- **foot mounting iC/iO** (foot mounted gear reducer housing), **flange mounting iC/iO** (up to 4 flanges for each gear reducer size), **shaft mounted iO**
- **gear reducer cast iron single piece housing**, high stiffness and dimensional accuracy;
- generously proportioned bearings of **low speed shaft** (bearings and shaft) in order to withstand high loads on shaft end;
- **high manufacturing quality standard**
- **high, reliable and tested performances**
- **compact motors**, under accuracy rating, also in brake version, suitable for applications with inverter.

Bevel helical gearmotors - iO

		iO 37	iO 47	iO 57	iO 67	iO 77	iO 87	iO 97

Shaft height (design PE, SE)	[mm]	100	112	132	140	180	212	265
B5 flange diameter (design FE)	[mm]	160	200	250	250	300	350	450
Maximum nominal torque	[N m]	224	450	670	925	1750	3000	4870
Maximum nominal radial load	[N]	5640	5920	7630	12300	16100	27300	40000

4.1.1 Gear reducer

Main structural features:

- cast iron single-piece housing 250 UNI ISO 185 with stiffening ribs and high lubricant capacity;
- low speed shaft ball or tapered roller bearings (on request for sizes ≥ iO 47 with hollow low speed shaft) amply sized to carry heavy loads on the low speed shaft end;
- pinion of final reduction with three bearings (sizes ≥ iC 57) in order to ensure the best meshing conditions (no overhung wheel, maximum rigidity and overload capacity, maximum reduction of noise level);
- first reduction stage pinion directly fitted with interference onto the motor shaft end;
- Gleason helical spur and spiral bevel gears with ground profile for maximum load capacity, smooth operation and quietness;

- gears load capacity calculated for tooth breakage and pitting according to standard ISO;
- oil-bath lubrication; all sizes are supplied filled with polyglycol synthetic oil (PAG), "for life" lubrication;
- metal plugs (filler plug with valve; drain plug; level plug);
- paint: external coating with two-component water-based acrylic enamel appropriate for resistance to normal industrial environments (corrosivity class C3 ISO 12944-2); color blue RAL 5010 DIN 1843; internal protection with paint providing resistance to synthetic oils.

4.1.2 Electric three-phase motor

Dimensions and masses of gearmotors described in present catalog are referred to standard motor and brake motors of catalog TX.

Main structural features:

- compact motor: asynchronous three-phase, totally-enclosed, externally ventilated, with cage rotor;
- IP 55 protection, insulation class F, temperature rise class B;
- rated power delivered on continuous duty (S1) and referred to nominal voltage and frequency, ambient temperature 40 °C and maximum altitude 1 000 m.
- suitable for running with inverter (generous electromagnetic sizing, low-loss eletrical stamping, phase separators, etc.);
- design available for every application need: flywheel, independent cooling fan, independent cooling fan and encoder, etc.
- paint: external protection with two-component water-based acrylic enamel appropriate for resistance to normal industrial environments (corrosivity class C3 ISO 12944-2); color blue RAL 5010 DIN 1843.

Brake motor main structural features

- particularly strong construction to withstand braking stresses; maximum reduction of noise level;
- spring-loaded d.c. electromagnetic brake; feeding from the terminal box;
- brake can also be independently fed directly from the line;
- braking torque proportioned to motor torque (usually $M_f \approx 2\ M_N$);
- rapid, precise stopping;
- hand lever for manual release with automatic return; removable lever rod.

For other specifications and details see specific documentation of catalog TX.

Specific standards for electric motors:

- nominal powers and dimensions to CENELEC HD 231 (IEC 72-1, CNR-CEI UNEL 13117-71 and 13118-71, DIN 42677, NF C 51- 120, BS 5000-10 and BS 4999-141) for mounting positions IM B5, IM B14 and derivatives;
- nominal performances and running specifications to CENELEC EN 60034-1 (IEC 34-1, CEI EN 60034-1, DIN VDE 0530-1, NF C51-111, BS EN 60034-1);
- protection to CENELEC EN 60034-5 (IEC 34-5, CEI 2-16, DIN EN 60034-5, NF C51-115, BS 4999-105);
- mounting positions to CENELEC EN 60034-7 (IEC 34-7, CEI EN 60034-7, DIN IEC 34-7, NF C51-117, BS EN 60034-7);
- sound levels to CENELEC 60034-9 (IEC 34.9, DIN 57530 pt. 9);
- balancing and vibration velocity (vibration under standard rating N) to CENELEC HD 53.14 S1 (IEC 34-14, ISO 2373 CEI 2-23, BS 4999-142); motors are balanced with half key inserted into shaft extension;
- cooling to CENELEC EN 60034-6 (CEI 2-7, IEC 34-6): standard type IC 411; type IC 416 for non-standard design with axial independent cooling fan.

4.2.1 Operational ambient temperature

Gear reducers

Gear reducers are suitable for operation at ambient temperature 0 °C / +40 °C (with peaks down to -20 °C / +50 °C).
The operation outside this range, with a minimum of -40 °C and a maximum of +60 °C, must be evaluated in relation to the specific operating conditions, duty cycle, type of lubricant, type of seals and cooling/heating system (where possible); please contact Rossi S.p.A.
The catalog data are based on an operational ambient temperature of 25 °C (see pages 53 and 54).

Motors

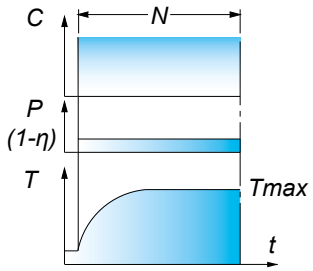
HB series motors are suitable for operation in an ambient temperature range of -15°C / +40°C.
The operation outside this range is possible by adopting some precautions: contact Rossi S.p.A.
For drives with inverters, it is necessary to take into account the higher thermal stresses to which the motor windings may be subjected.
If needed, contact Rossi S.p.A.

4.2.2 Installation altitude

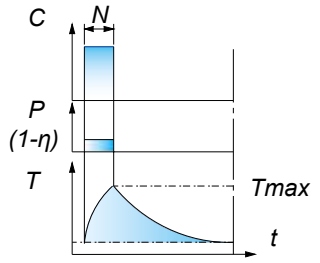
Installation altitude affects the effectiveness of convection heat dissipation; heat dissipation capacity decreases as installation altitude increases.
Catalog data are referred to a maximum altitude of 1000 m.

4.2.3 Duty cycles

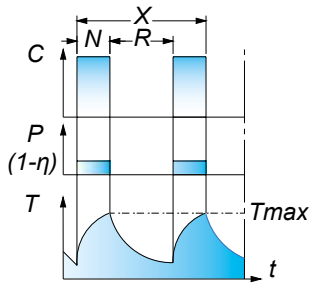
Continuous duty (S1)
Operation at a constant load maintained for sufficient time to allow the motor to reach thermal equilibrium.
Abbr. S1



Short time duty (S2)
Running at constant load for a given period of time less than that necessary to reach normal running temperature, followed by a rest period long enough for motor's return to ambient temperature.
Abbr. S2 + time N (minimum)



Intermittent periodic duty (S3)
Succession of identical work cycles consisting of a period of running at constant load and a rest period. Current peaks on starting are not to be of an order that will influence motor heat to any significant extent.
Abbr. S3 + cyclic duration factor



Cyclic duration factor = N/(N+R)·100 [%]

where

N = running time at constant load
R= rest time
For values of N+R > 10 min contact Rossi S.p.A.

In case of a duty-requirement type S2 ... S10 the motor power can be increased as per the following table; starting torque keeps unchanged.

Duty cycle			Motor size		
			63 ... 90	100 ... 132	160 ... 315
S2	duration of running	**90 min**	1	1	1,06
		60 min	1	1,06	1,12
		30 min	1,25	1,18	1,25
		10 min	1,25	1,25	1,32
S3	cyclic duration factor	**60%**		1,12	
		40%		1,18	
		25%		1,25	
		15%		1,32	
S4 ... S10			Contact Rossi S.p.A.		

4.2.4 Frequency 60 Hz

Motors up to size 132 wound for 50 Hz can be fed at 60 Hz keeping in mind the variation of nominal specifications, see specific documentation of TX series catalog.

4.2.5 Speed

Gearmotor low speed shaft rotation speeds indicated in the catalog are determined from the nominal HB motor speed under nominal operating conditions and gear reducer transmission ratio.
Actual speed may deviate from this value depending on load, actual operating conditions and power system.

4.2.6 Sound levels

The standard levels of sound power emission L_{WA} relevant to the gearmotors of this catalog, running at nominal load and speed, fulfill the limits settled by VDI 2159 for gear reducers and EN 60034 for motors.

4.2.7 Accessibility and heat dissipation

Position the gearmotor so as to allow a free passage of air for cooling both gear reducer and motor (especially at motor fan side).
Avoid any obstruction to the air-flow; heat sources near the gear reducer that might affect the temperature of cooling-air and of gear reducer for radiation; insufficient air recycle or any other factor hindering the steady dissipation of heat.
Also provide adequate spacing or shielding of heat-sensitive components (motor, brake, motor-inverter, electronic components, etc.) from hot surfaces of the driven machine, and provide adequate accessibility space for maintenance operations.

4.2.8 Weights

The weights shown in the catalog refer to gearmotors without lubricating oil.
Actual weights may vary depending on size, gearbox, transmission ratio, motor and whether there are accessories or special designs.

4.2.9 Reduced backlash

It is possible to supply the gearmotor in reduced backlash design for sizes ≥ iC 37 and ≥ iO 373. The values are given in paragraph 9.2 in the “Geometric Coupling Tables” and refer to the low speed shaft with locked high speed shaft.
They are valid in the absence of applied loads (max. 0,01 of the nominal load of the gear reducer), with the gear reducer at ambient temperature (25 °C) and are subject to a tolerance of ± 2 arc min.

If the value is not specified, the reduced backlash option is not available.

4.2.10 Low speed shaft seals

For aggressive environmental conditions or particularly severe operating conditions, the option “Sealing rings (gear reducer and motor) in fluoride compound” is available.
For gear reducer size ≥ iC 37 with flange and size ≥ iO 473 with flange and solid shaft it is possible to have the option «Double seal on low speed shaft».

4.3

Surface protection

The gearmotors are protected externally with a water-based dual compound acrylic enamel paint suitable for withstanding normal industrial environments (corrosivity class C3 ISO 12944-2; color blue RAL 5010).
Other paints and protection degrees are available on request as per table below.

Field of use	Features	Corrosivity class ISO 12944-2	Durability class ISO 12944-2	Description treatment	Thickness treatment µm	Code
Applications in aggressive ambients	Good resistance to atmospheric and aggressive agents	C4	Low	1) Dual-compound epoxy primer 2) Water-soluble polyurethane dual-compound enamel with polyurethane acrylic resins	150	**1HRAL5010 (blue)**
			Medium	1) Dual-compound epoxy primer (2 layers) 2) Water-soluble polyurethane dual-compound enamel with polyurethane acrylic resins	200	**2HRAL5010 (blue)**
			High	1) Dual-compound epoxy primer (4 layers) 2) Water-soluble polyurethane dual-compound enamel with polyurethane acrylic resins	300	**3HRAL5010 (blue)**
Outdoor applications in saline environment	Excellent resistance to atmospheric and aggressive agents Outdoor applications in saline environment	C5 - M	Medium	1) Sanding 2) Dual-compound antirust primer with zinc phosphates 3) Dual-compound epoxy primer 4) Water-soluble polyurethane dual-compound enamel with polyurethane acrylic resins	300	**2IRAL5010 (blue)** [1]
			High	1) Sanding 2) Dual-compound antirust primer with zinc phosphates 3) Sealing with polyurethane sealant 4) Dual-compound epoxy primer 5) Polyurethane dual-compound enamel with polyurethane acrylic resins	400	**2KRAL5010 (blue)** [1] [2]
Outdoor applications in chemically aggressive environment and high humidity industrial areas	Excellent resistance to atmospheric and aggressive agents Outdoor applications in chemically aggressive environment (fertilizers, etc.)	C5 - I	Medium	1) Sanding 2) Dual-compound antirust primer with zinc phosphates 3) Dual-compound epoxy primer 4) Water-soluble dual-compound enamel with epoxy resins	300	**2LRAL5010 (blue)** [1]
			High	1) Sanding 2) Dual-compound antirust primer with zinc phosphates 3) Sealing with polyurethane sealant 4) Dual-compound epoxy enamel 5) Water-soluble dual-compound enamel with epoxy resins	400	**2YRAL5010 (blue)** [1] [2]

[1] Available for sizes **≥ 47**.
[2] Not available on motors

4.4 Storage and warehousing

Rossi gearmotors must be stored in a closed environment where they are protected from solar radiation and corrosive agents. The ambient must be sufficiently clean, dry (relative humidity < 50 %), free from excessive vibrations (v_{eff} ≤ 0,2 mm/s) to avoid damage to bearings.

Ambient temperature 0 ÷ 40 °C; with peaks up to a ± 10 °C.

For different ambient conditions, contact Rossi S.p.A.

The gear units and gearmotors must be positioned according to the mounting position stated in the order and on the nameplate. **Do not stack units.**

Do not, under any circumstances, loosen the closed plugs or activate the drain plug before commissioning.

For storage periods of 12 to 24 months, we recommend requesting the "Long term storage" option, which provides:

- supply of the gearbox without oil filling;
- protection of the internal volume of the gearbox by applying VCI lubricant;
- application of a layer of special anti-corrosive oil on all unpainted external parts (shafts, feet, flanges), including galvanized components (screws, nuts, washers, eyebolts, etc.);
- application of adhesive label specific to the type of protection treatment;
- the packing with sealed VCI bag.

For longer periods please contact Rossi S.p.A.

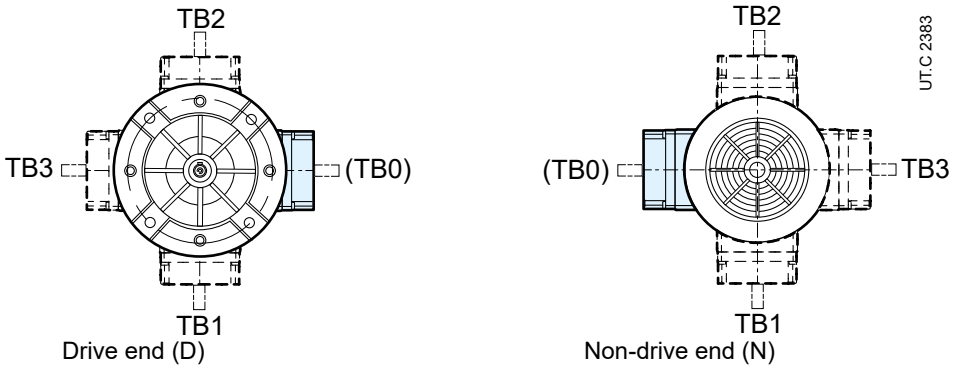
5.1.5 Motor terminal block



The designation is to be completed with the statement of motor terminal box position if differing from the standard one TB0 (see also pages 64, 65 for helical inline iC and pages 66,67,68 for bevel helical iO).
The release lever (for brake motor) follows the position of the terminal box.

The cable entry is the responsibility of the Buyer: the terminal box is integral with housing with knockout cable openings on both sides (one for power cable and one for auxiliary equipment).

[1)] For standard terminal box position TB0, no indication in motor designation is necessary.

5.1.8 Helical inline designation examples - iC

Example 1: compact gearmotor

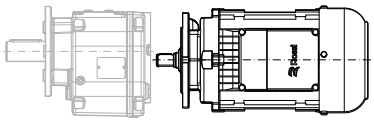
iC	4	7	3	FE	-	34,73	-	B3	-	F416	-	B16D

- helical inline gearmotor size iC 47
- 3 reduction stages
- design with flange
- metric shaft
- transmission ratio 34,73
- gear reducer mounting position B3
- output flange F416
- compact motor with mounting position B16D

Compact motor designation compatible with above coded gear reducer follows

HB	3	Z	90S	-	4	230.400	50	-	B16D	-	TB2

- motor type HB, with efficiency IE3, brake type
- motor size 90S
- number of poles 4
- supply voltage 230-400 V at 50 Hz
- compact motor with mounting position B16D
- terminal box position TB2



UT.C 2382

Example 2: gearmotor with IEC adapter

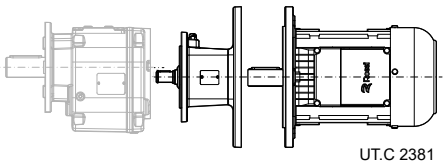
iC	4	7	3	FE	-	34,73	-	B3	-	F416	-	AB16DI090

- helical inline gearmotor size iC 47
- 3 reduction stages
- design with flange
- metric shaft
- transmission ratio 34,73
- gear reducer mounting position B3
- output flange F416
- standard IEC motor with adapter AB16DI090

IEC motor designation compatible with above coded gear reducer follows

HB	3	Z	90S	-	4	230.400	50	-	B5	-	TB2

- motor type HB, with efficiency IE3, brake type
- motor size 90S
- number of poles 4
- supply voltage 230-400 V at 50 Hz
- IEC motor mounting position TB2
- terminal box position TB2



UT.C 2381

5.1.9 Bevel helical designation examples - iO

Esempio 1: bevel helical gearmotor

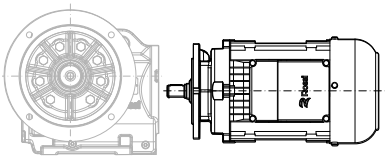
iO	5	7	3	FE	-	19,34	-	B3	-	SA	-	F525	-	B16D

- bevel helical gearmotor size iO 57
- 3 reduction stages
- design with flange
- metric shaft
- transmission ratio 19,34
- gear reducer mounting position B3
- solid low speed shaft S in A position
- output flange F525
- compact motor with mounting position B16D

Compact motor designation compatible with above coded gear reducer follows

HB	3	Z	90S	-	4	230.400	50	-	B16D	-	TB2

- motor type HB, with efficiency IE3, brake type
- motor size 90S
- number of poles 4
- supply voltage 230-400 V at 50 Hz
- compact motor with mounting position B16D
- terminal box position TB2



UT.C 2535

Esempio 2: bevel helical gearmotor with IEC adapter

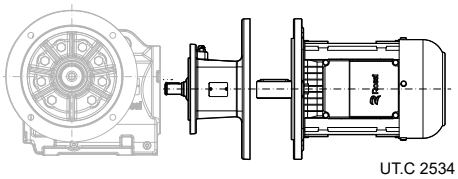
iO	4	7	3	SE	-	19,58	-	B3	-	HBB	-	AB16DI090

- bevel helical gearmotor size iO 47
- 3 reduction stages
- esecuzione pendolare
- metric shaft
- transmission ratio 19,58
- gear reducer mounting position B3
- hollow low speed shaft with shrink disc HB in B position
- standard IEC motor with adapter AB16DI090

IEC motor designation compatible with above coded gear reducer follows

HB	3	Z	90S	-	4	230.400	50	-	B5	-	TB2

- motor type HB, with efficiency IE3, brake type
- motor size 90S
- number of poles 4
- supply voltage 230-400 V at 50 Hz
- IEC motor mounting position TB2
- terminal box position TB2



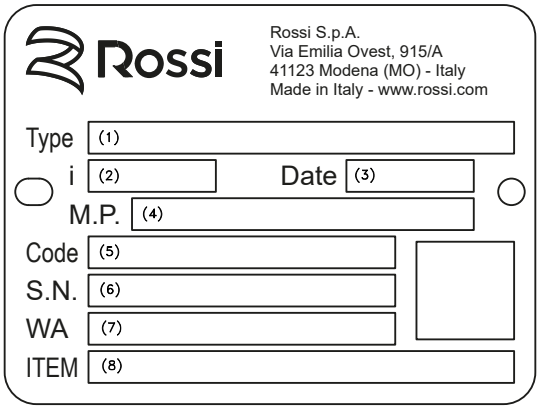
UT.C 2534

5.2

Nameplate data

5.2.1 Gear reducer nameplate

Every gear reducer is provided with a name plate in anodized aluminium containing main informations necessary for a correct identification of the product.
The name plate must not be removed and must be kept integral and readable.
All name plate data must be specified on eventual spare part orders.



(1) Gear reducer type
(2) Transmission ratio
(3) Production date
(4) Gear reducer mounting position
(5) Product code
(6) Serial number
(7) Production batch
(8) Customer code [1]

5.2.2 Motor nameplate

The motor is provided with a nameplate in anodized aluminium containing main information necessary for a correct identification of the project.
The name plate must not be removed and must be kept integral and readable.
All name plate data must be specified on eventual spare part orders.

6.5.5	Radial load not in center line	56

6.1 Selection

6.1.1 Selection data

For a correct selection of gearmotor and drive, the following information about the application is required

Symbols	Description	Unit of Measure SI
n_{2min}	minimum rotation speed required on low speed shaft	[min^{-1}]
n_{2max}	maximum rotation speed required on low speed shaft	[min^{-1}]
$P_{2-n2\ min}$	power required at low speed shaft at minimum speed	[kW]
$P_{2-n2\ max}$	power required at low speed shaft at maximum speed	[kW]
$M_{2-n2\ min}$	torque required at low speed shaft at minimum speed	[N m]
$M_{2-n2\ max}$	torque required at low speed shaft at maximum speed	[N m]
F_{a2}	axial loads on low speed shaft	[N]
F_{r2}	radial loads on low speed shaft	[N]
J	external moment of inertia of mass (couplings, driven machine)	[kg m^2]
T_{amb}	(maximum and minimum) ambient temperature	[°C]
H	installation altitude	[m]
$S1, S2,..$	duty cycle	[%]
z	number of starts per hour	[start/h]
f	supply frequency	[Hz]
U_{mot}	motor supply voltage	[V]
U_f	brake supply voltage	[V]
M_f	braking torque	[N m]
$B3 \dots V6$	gearmotor mounting position	

6.1.2 Selection of gearmotor size

In order to select the most suitable gearmotor size for the application, you must:

1 have the necessary data as indicated in the previous paragraph:
- power P_2 required at gearmotor output;
- angular speed n_2,
- operating conditions (nature of the load, duration, frequency of starting z, other considerations).

2 determine service factor *fs* on the basis of running conditions (page 52).

3 select the gearmotor size on the basis of:
- n_2
- *fs*
- power P_1 equal or greater than P_2

If power P_2 required is the result of a precise calculation, the gearmotor should be selected on the basis of a power P_1 equal or greater than P_2 / η , where η = 0,97 ÷ 0,98 is gear reducer efficiency (page 52).
When for reasons of motor standardization, power P_1 available in catalog is much greater than the power P_2 required, the gearmotor can be selected on the basis of a lower service factor provided it is certain that this excess power available will never be required and frequency of starting z is low enough not to affect service factor (page 52).
Calculations can also be made on the basis of torque instead of power; this method is even preferable for low n_2 values.

6.1.3 Verifications

- Verify possible radial load F_{r2} referring to directions given on pages 55 and 56.
- For the motor, verify frequency of starting z when higher than that normally permissible, referring to directions and values given in ch. 2 cat. TX; this will normally be required for brake motors only.
- When a load chart is available, and/or there are overloads – due to starting on full load (especially with high inertias and low transmission ratios), braking, shocks, gear reducers in which the low speed shaft becomes driving member due to driven machine inertia, applied power higher than strictly required, other static or dynamic causes - verify that the maximum torque peak is always smaller than $\boldsymbol{1,6 \cdot M_{N2}}$ (where $M_{N2} = M_2 \cdot fs$).
  If higher or if it cannot be evaluated in the above cases, install safety devices so that $\boldsymbol{1,6 \cdot M_{N2}}$ will never be exceeded.

6.1.4 Start and stop overloads

Starting torque

When starting on full load (especially for high inertias and low transmission ratios) verify that starting torque $M_{2\ starting}$ is:

$$M_{2\ starting} = \left(\frac{M_{starting}}{M_N} \cdot M_{2\ available} - M_{2\ required} \right) \cdot \frac{J_1}{J_1 + J_0} + M_{2\ required} < 1,6 \cdot M_{N2}$$

where

- $M_{2\ required}$ is the torque absorbed by the machine through work and frictions;
- $M_{2\ available}$ is the output torque due to motor nominal power;
- J_0 is the moment of inertia (of mass) of the motor;
- J_1 is the external moment of inertia (of mass) in kg m^2 (gear reducers, couplings, driven machine) referred to the motor shaft $J_1 = J / i^2$.

When seeking to verify that starting torque is sufficiently high for starting, take into account starting friction, if any, in evaluating M_2 required.

Braking torque

In case of **stopping machines with high kinetic energy** (high moments of inertia combined with high speeds) and **with brake motors**, verify braking stress by means of the formula

$$\left(\frac{M_f}{\eta} \cdot i + M_{2\ required} \right) \cdot \frac{J_1}{J_1 + J_0} + M_{2\ required} < 1,6 \cdot M_{N2}$$

where

- M_f is the braking torque setting (see table on page 218)
- η is the efficiency
- i is the transmission ratio
- J_0 is the moment of inertia (of mass) of the motor;
- J_1 is the external moment of inertia (of mass) in kg m^2 (gear reducers, couplings, driven machine) referred to the motor shaft $J_1 = J / i^2$.

Attention:
Where no evaluation is possible, install safety devices which will keep values within $M_{2\ max} = 1,6 \cdot M_{N2}$

6.1.5 Operation with brake motor

Starting time t_a and revolutions of motor φ_{a1}

$$t_a = \frac{(J_0 + J_1) \cdot n_1}{9.55 \cdot \left(M_{starting} - \frac{M_{2\ required}}{i}\right)} \text{ [s]} \qquad \varphi_{a1} = \frac{t_a \cdot n_1}{19.1} \text{ [rad]}$$

Braking time t_f and revolutions of motor φ_{f1}

$$t_f = \frac{(J_0 + J_1) \cdot n_1}{9.55 \cdot \left(M_f + \frac{M_{2\ required}}{i}\right)} \text{ [s]} \qquad \varphi_{f1} = \frac{t_f \cdot n_1}{19.1} \text{ [rad]}$$

where:

- $M_{starting}$ is the motor starting torque $\left(\frac{9550 \cdot P_1}{n_1} \cdot \frac{M_{starting}}{M_N}\right)$
- M_f is the braking torque setting of the motor (see page 218)
- φ_{a1} is the revolution of motor during starting time t_a (see page 218)
- φ_{f1} is the revolution of motor during braking time t_f (see page 218)
- J_0 is the moment of inertia (of mass) of the motor;
- J_1 is the external moment of inertia (of mass) in kg m^2 (gear reducers, couplings, driven machine) referred to the motor shaft.

For other symbols, see page 20 and table on page 48.

Assuming a regular air-gap and ambient humidity, and utilizing suitable electrical equipment, repetition of the braking action, as affected by variation in temperature of the brake and by the state of wear of friction surface, is approx $0{,}1 \cdot \varphi_{f1}$.

6.1.6 Considerations on motor power

Taking into account the efficiency of the gear reducer, and other drives – if any – **motor power** is to be as near as possible to the power rating required by the driven machine: accurate calculation is therefore recommended.

The power required by the machine can be calculated, taking into account its components:

- power due to the work to be done,
- power required to overcome friction (first detachment, sliding or rolling)
- power required to overcome inertia (especially when the mass and/or acceleration or deceleration is large);

or determined experimentally based on tests and comparisons with existing applications, amperometric and wattmetric readings.

Oversizing the motor involves:

- higher starting current and therefore larger fuse valves and conductor section;
- a higher operating cost as it worsens the power factor (cos φ) and also the efficiency;
- greater stress on the drive, causing danger of mechanical failure, drive being normally proportionate to the power rating required by the machine, not to motor power.

Only high values of ambient temperature, altitude, frequency of starting or other particular conditions require an increase in motor power.

6.2 Service factor

Service factor *fs* takes into account the different running conditions which the gearmotor must be referred to:

- nature of load;
- duration;
- frequency of starting;

and other consideration to be considered in the calculations of gear reducer selection and verification.
For a quick and rough selection, the following table gives the minimum service factor *fs* required according to the kind of the driven machine.

Load classification		Driven machine	*fs* ≥
I	**Uniform load** ($m_J \leq 0,3$)	Fans (small diameters) Agitators (liquids at low and constant density) Mixers (low density and uniform materials) Belt conveyors (fine grade loose materials) Auxiliary commands Assembly lines Filling machines Compressors Centrifugal pumps (liquids with low and constant density) Elevators Escalations	**1**
II	**Moderate overloads** ($m_J \leq 3$)	Fans (average diameters) Agitators (liquids, high or variable density) Mixers (variable density materials) Belt conveyors (coarse bulk materials) Translations Dosing pumps Gear pumps Multi-cylinder piston pumps Centrifugal Pumps (high or variable density liquids) Palletizers Slewing gears Palletizing equipments Bottling machines Hoists Sliding doors	**1.32**
III	**Heavy overloads** ($m_J \leq 10$)	Bucket elevators Roller ways Heavy duty mixers (solid and heterogeneous materials) Bridge crane translations Mechanisms (cranks, eccentrics) Shears (sheet metal) Bending rolls Centrifuges Presses (crank, toggle, eccentric)	**1.6**

For a more accurate calculation of the required service factor (especially considering the running hours), proceed as stated below

1) Calculate the mass acceleration factor m_J:

$$m_J = \frac{J_1}{J_0}$$

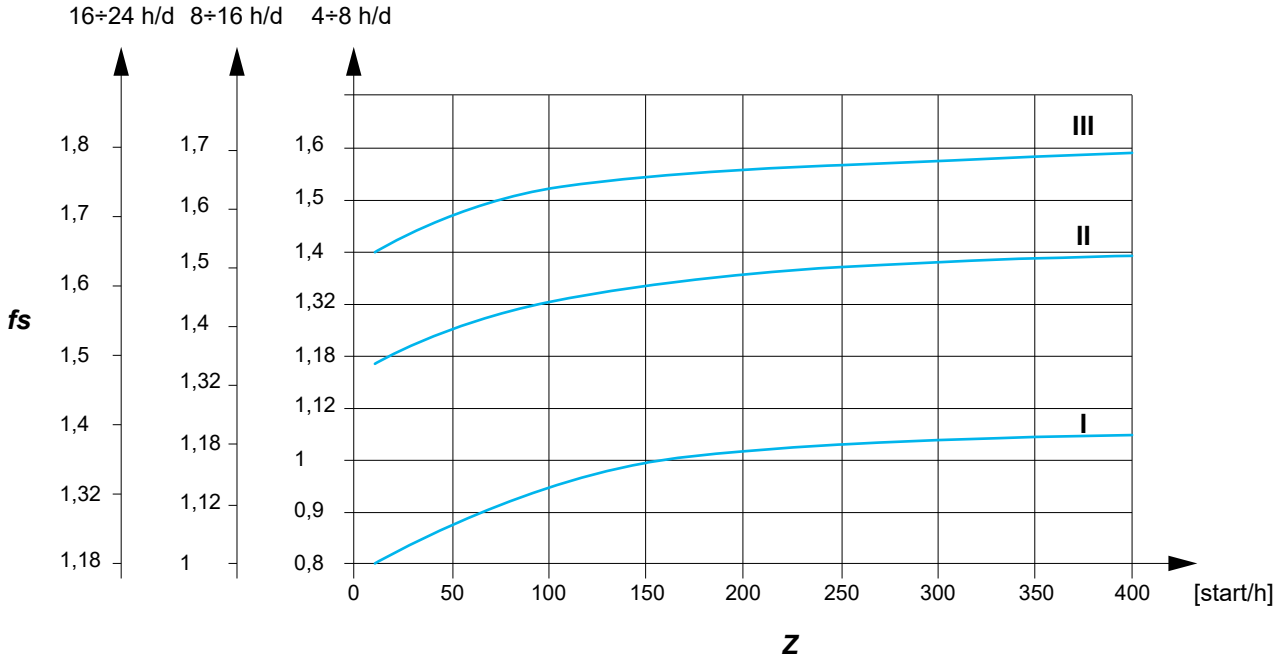
where:
- J_1 [kg m²] is the external moment of inertia J (of mass; coupling, driven machine), referred to motor shaft $J_1 = J / i^2$;
- J_0 [kg m²] is the moment of inertia (of mass) of motor (see. cat. TX) including brakes, flywheel, etc.
- i is the transmission ratio of selected gear reducer.

2) Select the proper overload class according to the acceleration mass factor m_J

$m_J \leq 0,3$ (uniform) **class I**
$m_J \leq 3$ (moderate overloads: ≈ 1,6 x normal) **class II**
$m_J \leq 10$ (heavy overloads: ≈ 2,5 x normal) **class III**

For m_J values higher than 10, in presence of high values of backlash for kinematic chain and/or high radial loads a specific evaluation has to be carried out: contact Rossi S.p.A.

3) From the diagram below, according to the overload class, the running time and the starting frequency **z**, read off the service factor required.



6.3 Efficiency

Gear reducer efficiency is determined by the friction of the sliding and rolling surfaces (gears, bearings and seals) and by the oil splash leakage of the lubricating oil.
The value of efficiency is influenced by operating conditions (load and speed) and can reach a maximum value up to

- maximum efficiency 0,97 (for 3 stages iC and iO gear reducers)
- maximum efficiency 0,98 (for 2 stages iC gear reducers).

The power loss due to efficiency is dissipated as heat flow through the outer surfaces of the gearmotor.

In order not to overheat the lubricant and seal material, **it must be ensured that the power applied does not exceed the heat dissipation capacity of the gearmotor.**

6.4 Thermal power

The nominal thermal power P_{TN} [kW] is that which can be applied at the gear reducer input, without exceeding 95 °C approximately oil temperature when operating in following running conditions:

- input speed n_1 = 1400 min^{-1} (4 poles motor, 50 Hz);
- mounting position B3, B6, B7, B8;
- continuous duty *S1*;
- maximum ambient temperature 25 °C;
- maximum altitude 1000 m a.s.l.
- air speed ≥ 1,25 m/s (typical value in presence of a gearmotor with self-cooled motor)

The gearmotor combinations shown in chapters 9 and 11 are already thermally verified for all of the above conditions, including 2-pole combinations.

Otherwise it is necessary to verify that the applied power P_1 is less than or equal to the gearbox rated thermal power P_{TN} (indicated in the table) multiplied by the corrective coefficients f_{T1}, f_{T2}, f_{T3}, f_{T4}, f_{T5} (indicated in the tables) that take into account the different operating conditions:

$$P_1 \leq P_{TN} \cdot f_{T1} \cdot f_{T2} \cdot f_{T3} \cdot f_{T4} \cdot f_{T5}$$

If verification is not met, evaluate the use of special lubricants or heat exchanger cooling units, contact Rossi S.p.A.

Thermal power needs not be taken into account when maximum duration of continuous running time is 1 ÷ 3 h, for all gear reducer sizes, followed by rest periods long enough to restore the gear reducer to near ambient temperature.
In case of maximum ambient temperature above 50 °C or below 0 °C, contact Rossi S.p.A.

Nominal thermal power P_{TN} **[kW]:**

	P_{TN} [kW]

Air speed m/s	**Installation environment**	f_{T5}
< 0,63	very small environment or without air movements or with protected gear reducer	(1)
0,63	very small environment and with limited air movements	0,71
1	wide environment without air movements	0,9
1,25	wide environment with light air movements (e,g, gearmotor with self-cooled motor)	**1**
2,5	open and cooled	1,18
4	with heavy air movements	1,32

(1) Contact Rossi S.p.A.

6.5.1 General

Radial loads generated on the shaft end by a drive connecting gearmotor and machine must be less than or equal to those given at ch. 9 and 11 as bearing life and wear (which also affects gears unfavourably) and low speed shaft strength clearly impose limits on permissible radial load.

6.5.2 Determination of the applied radial load

For the most common drives, radial load F_{r2} can be determined using the following formula where k takes on different values in relation to transmission type

$$F_{r2} = k \cdot \frac{2 \cdot M_2}{d} \quad [N]$$

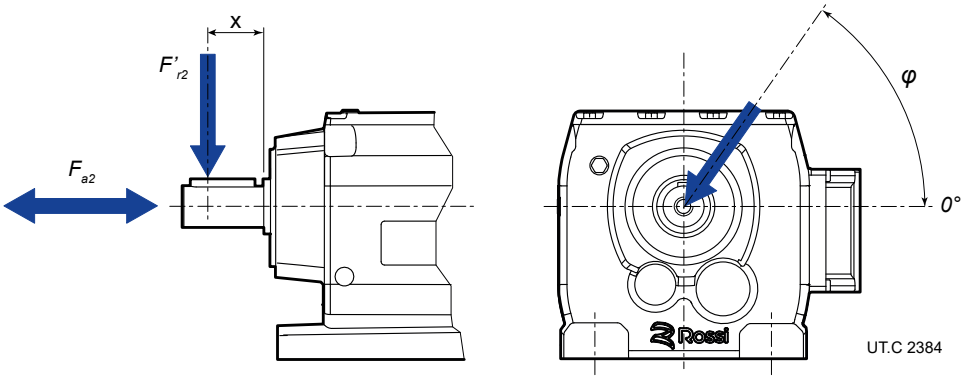
where:

- M_2 [N m] is the torque required by the gearmotor low speed shaft;
- d [m] is the pitch diameter;
- k is a coefficient which assumes different values according to transmission type:
  - k = 1 for chain drive (lifting in general);
  - k = 1,5 for timing belt drive;
  - k = 2,5 for V-belt drive;
  - k = 1,1 for spur gear pair drive;
  - k = 3,55 for friction wheel drive.

6.5.3 Permissible radial load

The values of permissible radial load F_{r2} are indicated in the tables of ch. 9 and are valid for foot mounted gearmotor design (P…).
These values are referred to gearmotor's output speed n_2 and torque M_2,considering overhung load acting on centre line of low speed shaft end, on A side (for iO gearmotors), in the most unfavorable direction of rotation and angular position of load.

If the exact direction of rotation and angular position of load are known, an increase of permissible radial load may be achieved.
On request, the option with strengthened bearings on low speed shaft is available (see page 41).
For the verification of each specific case contact Rossi S.p.A. with the notation shown in the figure.



6.5.4 Permissible axial load

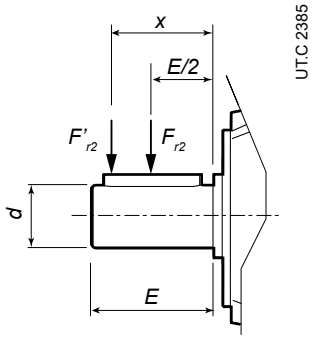
In absence of the radial load, an axial load may be acting on center line, not higher than 0,5 times the radial load stated in ch. 9. An **axial load** of up to 0,2 times the value in the table is permissible, simultaneously with the radial load, see ch. 9 and 11.

If exceeded and/or for **misaligned axial loads**, contact Rossi S.p.A.

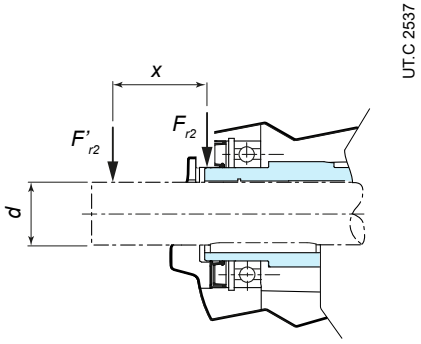
6.5.5 Radial load not in center line

In the case of radial load acting in a position other than the centre line, i.e. at a distance from the shoulder other than 0,5 · E, you have to recalculate the permissible radial load value at distance x (F'_{r2x}) from the value given in chap. 9 and 11 using the minimum value given by the following formulae.

Solid shaft



Hollow output shaft



$$F'_{r2b} = F_{r2} \cdot \frac{E/2 + y}{x + y} \quad [N]$$

$$F'_{r2s} = \frac{m}{x + q} \quad [N]$$

$$F'_{r2} = min\,(F'_{r2b}\,;\, F'_{r2s}) \quad [N]$$

where

- F'_{r2b} [N] is the permissible radial load, according to bearing life, acting at the distance *x* from shaft shoulder;
- F'_{r2s} [N] is the permissible radial load, according to shaft strength, acting at the distance *x* from shaft shoulder;
- F_{r2} [N] is the permissible radial load acting on center line of gearmotor low speed shaft end (see ch. 9 and ch. 11);
- F'_{r2} [N] is the permissible radial load acting at the distance *x* from shaft shoulder;
- E [mm] is the gearmotor low speed shaft end length;
- *d* [mm] diameter of gearmotor low speed shaft end;
- *x* [mm] is the distance between the gearmotor low speed shaft shoulder and the load application point;
- *y* [mm] is a parameter that depends on the geometry of the gearmotor low speed shaft;
- *m* [N mm] is a parameter that depends on the geometry of the gearmotor low speed shaft;
- *q* [mm] is a parameter that depends on the geometry of the gearmotor low speed shaft.

Gearmotor size	*E/2 + y* mm	*y* mm	*m* N mm	*q* mm	*d* mm	*E* mm

7.1

Mounting positions

7.1.1 General

The mounting positions below show the possible mounting positions of the different gearmotor designs by Rossi S.p.A.

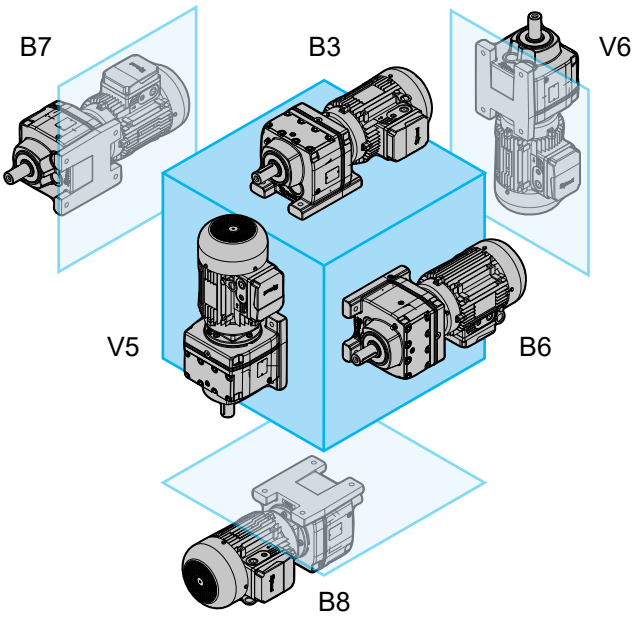
Except specific needs, prefer mounting position B3 as it is the most advised from a technical and economic point of view:

- maximum simplification of lubrication system,
- less oil splash,
- less gear reducer heating;
- greater availability of stock products.

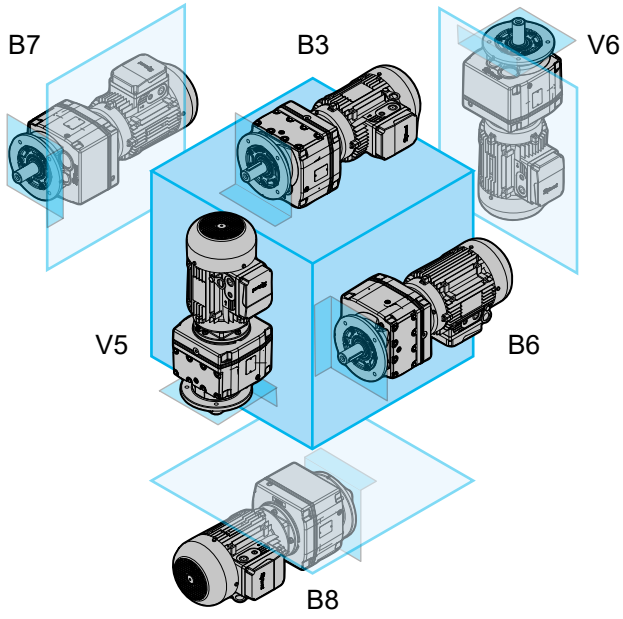
For inclined or oscillating mounting positions contact Rossi S.p.A.

HELICAL INLINE GEARMOTORS - iC

PE - foot mounted design

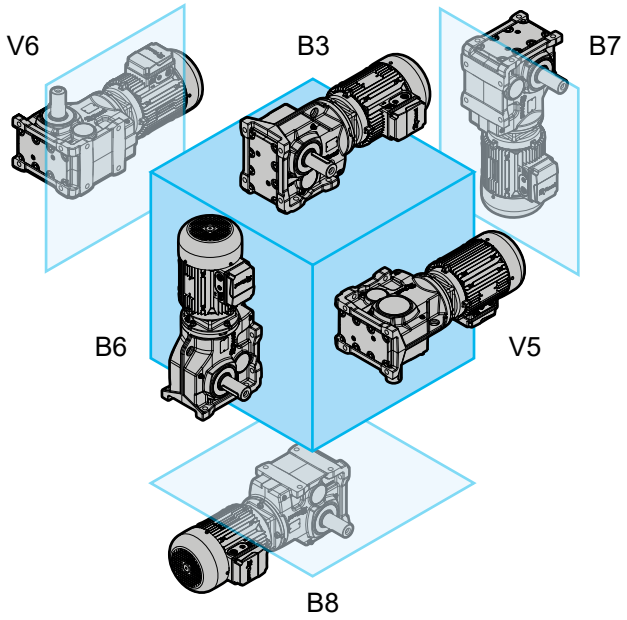


FE - flange mounted design

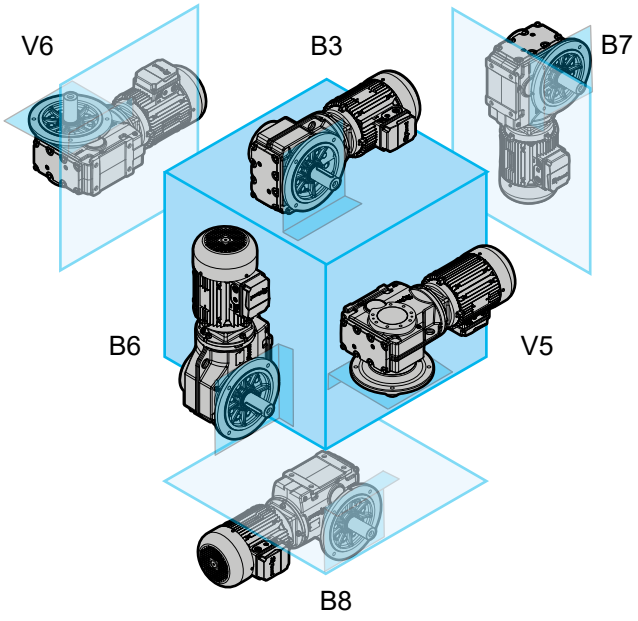


BEVEL HELICAL GEARMOTORS - iO

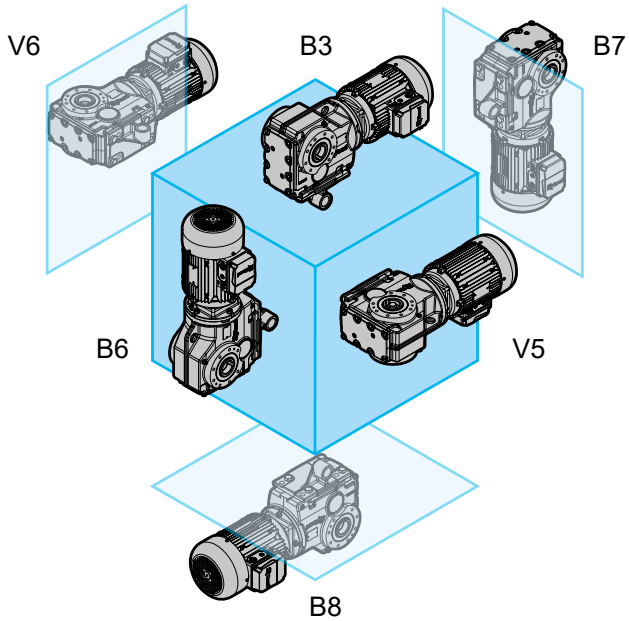
PE - foot mounted design



FE - flange mounted design



SE - shaft mounted design



7.1.2 Change of mounting position

If gear reducer is installed in a mounting position differing from the one stated on name plate please follow these instructions:

- adjust the position of breather plug (see pages 64, 65 for helical inline iC and pages 66, 67, 68 for bevel helical iO)
- adjust lubricant quantity (see page 72) up to the oil level foreseen, checking that there are no more gas pockets in the oil which is included in the gear reducer
- for the changeover to mounting position V5 or V6 contact Rossi S.p.A.

7.1.3 Universal mounting position BX

In this mounting position the gearmotors are supplied completely full of lubricant with all closed plugs, and with a loose breather plug as standard.

Before commissioning, please follow these instructions:

- position the breather plug correctly in the position foreseen by the operation mounting position (see pages 64, 65 for helical inline iC and pages 66, 67, 68 for bevel helical iO)
- adjust oil quantity according to operation mounting position (see page 72).

7.2 Plug position

7.2.1 Positions of breather and drain plug

The position of breather and drain plug depend from gearmotor mounting position, see following pages.
Following table shows when the breather or drain plugs lay on motor flange, according to gearmotor mounting position.

Mounting position		Position of breather plug	Position of drain plug
iC	iO		
B3, B6, B7, B8	B3, B8, V5, V6	in gear reducer housing	in gear reducer housing
V5	B6	in motor flange	in gear reducer housing
V6	B7	in gear reducer housing	in motor flange

When the breather plug or the drain plug are on motor flange, their angular position is determined on the basis of motor terminal box position.
All figures in this catalog represent breather and drain plugs with motor terminal box in standard TB0 position (see pages 40 and 64,65,66,67,68).
The exact position of the breather and drain plugs according to the position of the motor terminal box is shown on the next page.

8.1 Lubrication

8.1.1 General

Gear lubrication is oil bath or splash lubrication, and bearings are splash lubricated or grease lubricated for “life” (with or without NILOS ring).
Unless otherwise stated, gearmotors are **supplied filled with synthetic oil** (KLÜBER KlüBersynth GH 6-220, MOBIL Glygoyle 220, SHELL Omala S4 WE 220), providing lubrication – assuming pollution-free surroundings – “long life”.

Ambient temperature range 0 ÷ 40 °C with peaks of -20 °C and +50 °C.

Important:
the order-specific mounting position determines the quantity of lubricant supplied to the gear unit at the time of delivery as well as whether there are bearings with independent lubrication.
Always be sure that the gearmotor is located as per the mounting position ordered, which appears on the name plate.
If the gearmotor is installed in a different mounting position verify, according to the values given in the table, that the oil quantity doesn't change; if so, adjust it consequently.
In addition, the vertical V5 and V6 mounting position requires the application of special grease in the upper bearing.
The mounting position can be changed only with previous authorization by Rossi S.p.A., otherwise the warranty is void.

8.1.2 Oil quantity

Stated lubricant quantities are approximate and indicative for provisioning. The exact quantity the gear reducer is to be filled with is definitely given by the level.

8.1.3 Lubricants table

Important:
Inappropriate lubricants can cause damage to the gear reducer.

The viscosity and type of lubricating oil used for filling **are indicated on the adhesive name plate on the gear reducer.**
Rossi S.p.A. declines any responsibility for damages deriving from the use of other lubricants or from the use outside the expected ambient temperature range. The indications on lubricants do not bind Rossi S.p.A. on the quality of the lubricant supplied by each respective manufacturer. Do not mix different lubricating oils; do not mix synthetic oils with mineral oils.

Brand	Synthetic PAO oil	Synthetic PAG oil	Mineral oil
AGIP	Blasia SX	Blasia S	Blasia
ARAL	Degol PAS	Degol GS	Degol BG
BP	Enersyn EPX	Enersyn SG-XP	Energol GR-XP
CASTROL	Alphasyn EP	Optiflex A	Alpha SP
FUCHS	Renolin Unisys	Renolin PG	Renolin CLP

Brand	Synthetic PAO oil	Synthetic PAG oil	Mineral oil
KLÜBER	Klübersynth GEM4	Klübersynth GH6	Klübersynth GEM1
MOBIL	Mobil SHC Gear	Mobil Glygoyle	Mobilgear 600 XP
SHELL	Omala S4 GX	Omala S4 WE	Omala S2 G
TEXACO	Pinnacle	Synlube CLP	Meropa
TOTAL	Carter SH	Carter SY	Carter EP

8.1.4 ISO viscosity grade

Unless otherwise specified, the gearmotors are **supplied complete with synthetic oil** of viscosity grade ISO VG 220 suitable for most applications in normal industrial environments. For different application conditions or specific needs, please contact Rossi S.p.A.
The following table provides a general guideline for lubricant viscosity selection (average cSt value of kinematic viscosity at 40 °C).

Speed n_2 min^{-1}	**Ambient temperature** T_{amb} C°		
	Mineral Oil		*Synthetic oil*
	0 ÷ 20	10 ÷ 40	0 ÷ 40
> 224	150	150	150
224 ÷ 22.4	150	220	220
22.4 ÷ 5.6	220	320	320
< 5.6	320	460	460

Ambient temperature peaks of ± 10 °C for mineral oils and ± 20 °C for synthetic oils are permissible with respect to the conditions given in the table.

8.1.5 Oil change intervals

An overall guide to oil-change interval is given in the table, and assumes pollution-free surroundings.
When heavy overloads are present, halve the values.

Oil temperature °C	**Oil change interval** [h]	
	Mineral Oil	*Synthetic oil*
≤ 65	8000	25000
65 ÷ 80	4000	18000
80 ÷ 95	2000	12500

Seal rings:
Duration depends on several factors such as dragging speed, temperature, ambient conditions, etc.; as a rough guide it can vary from 3150 to 25000 h.

8.1.6 Breather plugs

The gearmotors are supplied complete with a (metal) breather plug with valve mounted in the correct position according to the type of mounting position (except for type BX, see page 62).
Before commissioning it is necessary to activate the breather by tearing the closing tab on the plug.
It is necessary to keep the breather free from dirt that could compromise its functionality.
In case this is not possible, please contact Rossi S.p.A. to find a different solution.

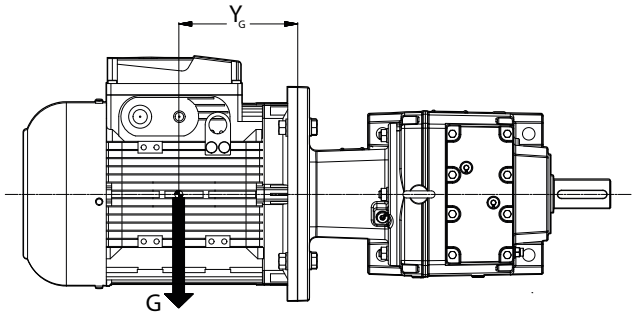
8.3

Assembling the motor (IEC or NEMA) on adapter

Prior to fitting the customer-supplied motor, verify that the static bending torque M_b generated by the weight of the motor on the adapter counterflange is below the permitted value M_{bmax}, shown in table below:

$M_b < M_{bmax}$

where:



UT.C. 2440

$M_b = (G \cdot Y_G) / 1000$ [N m]

G [N] motor weight; numerically approximately equal to motor mass, expressed in kg, multiplied by 10.

Y_G [mm] distance of motor center of gravity from flange surface

Motors that are too long and too thin, even if the bending moment is below the prescribed table limits, can generate abnormal vibrations during operation.

In these cases, a suitable additional motor support must be provided (see specific motor documentation).

Loads above those permitted may be present in dynamic applications if the gearmotor is subject to translation, rotation or oscillation: contact Rossi to examine each individual case.

8.5

Fastening bolts

Unless otherwise stated, usually it is sufficient to use bolts in class 8.8; The following cases are an exception, for which bolts with strength class 10.9 must be used:

- iC 372 - iC 373 FE with flange F312
- iC 472 - iC 473 FE with flange F414
- iC 572 - iC 573 FE with flange F516

Thoroughly degrease the bolts before tightening. It is recommended to apply locking adhesives on the fastening bolts and on flange mating surfaces, in the event of heavy vibrations, heavy duties and/or frequent drive inversions.
Tighten the bolts to the tightening torque stated in the table.

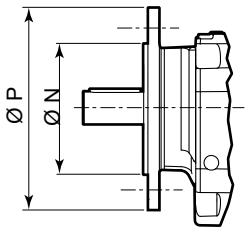
Ø N > 230 mm (Ø P 350 ÷ 450 mm) ⟶ tolerance ISO h6

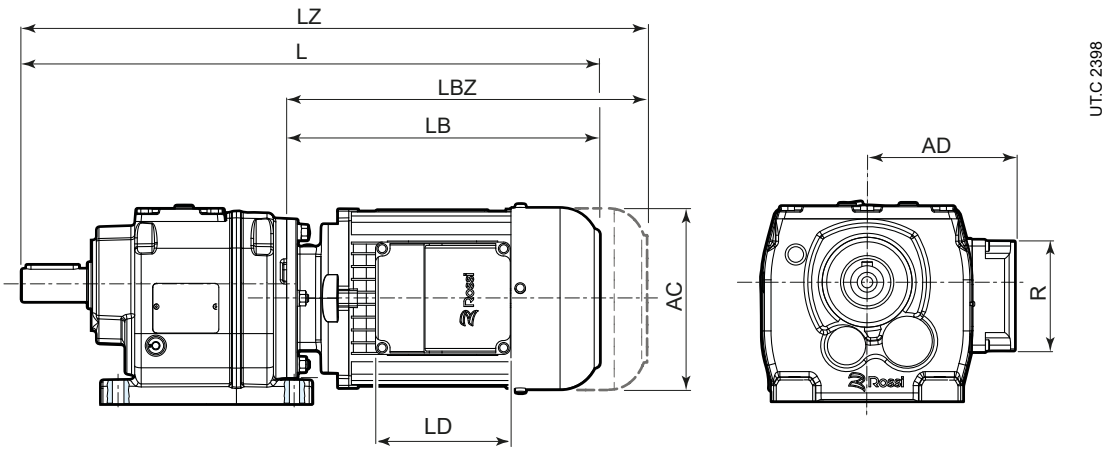


8.7

Overall dimensional remarks

8.7.1 Overall dimension details of HB and HBZ motors

The meaning of the total dimensions shown in the drawings in ch.10 and 12 is explained below:



where:

- L — total length of gearmotor
- LZ — total length of gearmotor with brake
- LB — total length of motor
- LBZ — total length of motor with brake
- AC — diameter of motor fan cover
- LD — length of motor terminal box
- AD — radial dimensions of motor terminal box
- R — width of motor terminal box

Motor length and terminal box dimension can slightly change according to specific motor options; if necessary, refer to cat. TX. or contact Rossi S.p.A.

Eyelets and eyebolts for lifting

Sizes ≤ **iC** 57… are equipped with lifting eyelet for transport. Larger sizes are equipped with eyebolts.
All **iO** bevel helical gearmotors are equipped with a “lifting hole” on the housing for handling.

Breather plugs:
Dimensional drawings indicated at ch. 10 and ch. 12 do not indicate the dimensions of breather plug as its position depends on mounting position.
Total overall dimensions can slightly differ from the stated ones.

9.1

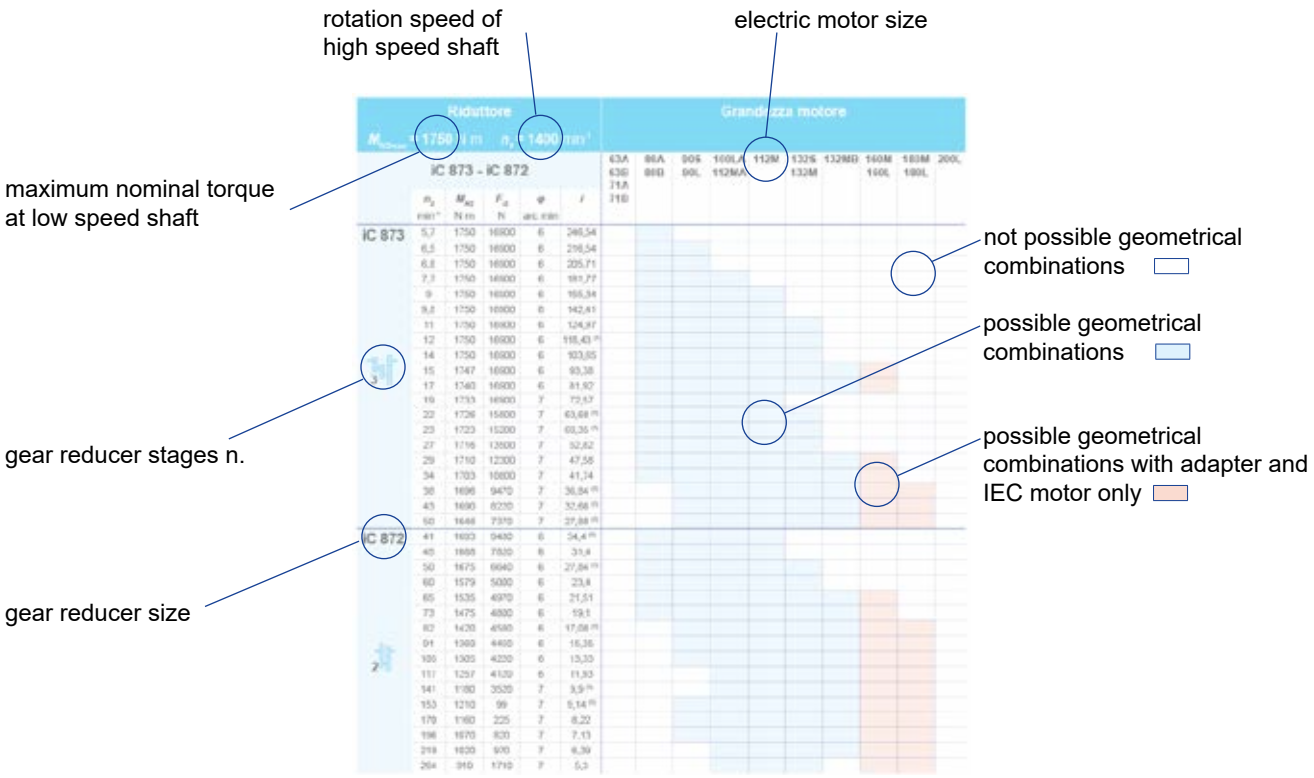
Possible geometrical combinations

9.1.1 General

The tables in the following pages show the geometrical coupling possibilities with HB 4 poles motors, according to train of gears (2 or 3 stages) and transmission ratio.
Also the low speed shaft rotation speed n_2, calculated according to a nominal input speed equal to n_1 = 1400 min^{-1}, are shown.
The values of the nominal torque at the low speed shaft M_{N2} and of the permissible radial load F_{r2} acting on the center line are also referred to this speed.

At the time of selection, it is necessary to evaluate the actual operating conditions in relation to the actual power of the applied motor as indicated in ch. 6.

9.1.2 Key



where

- n_2 low speed shaft rotation speed
- M_{N2} nominal torque at low speed shaft
- F_{r2} permissible radial load acting on center line of low speed shaft
  (at speed n_2 and with torque M_{N2} indicated in the table - valid only for foot mounted gearmotor design)
- φ reduced backlash, referred to low speed shaft
  (tolerance ± 2 arc min - if value is not specified, the reduced backlash option is not available)
- i transmission ratio

11.1

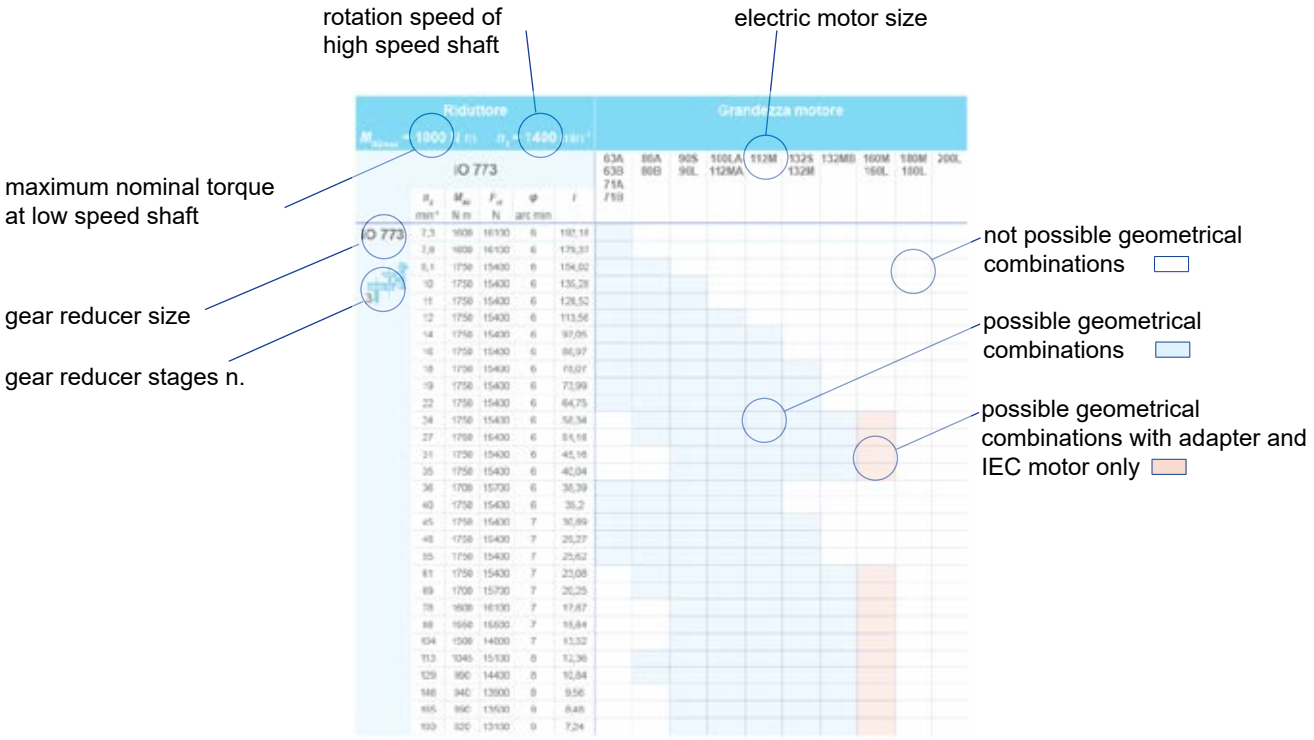
Possible geometrical combinations

11.1.1 General

The tables in the following pages show the geometrical coupling possibilities with HB 4 poles motors, according to train of gears (2 or 3 stages) and transmission ratio.
Also the low speed shaft rotation speed n_2, calculated according to a nominal input speed equal to n_1 = 1400 min^{-1}, are shown.
The values of the nominal torque at the low speed shaft M_{N2} and of the permissible radial load F_{r2} acting on the center line are also referred to this speed.

At the time of selection, it is necessary to evaluate the actual operating conditions in relation to the actual power of the applied motor as indicated in ch. 6.

11.1.2 Key



where

- n_2 low speed shaft rotation speed
- M_{N2} nominal torque at low speed shaft
- F_{r2} permissible radial load acting on center line of low speed shaft
  (at speed n_2 and with torque M_{N2} indicated in the table - valid only for foot mounted gearmotor design)
- φ reduced backlash, referred to low speed shaft
  (tolerance ± 2 arc min - if value is not specified, the reduced backlash option is not available)
- i transmission ratio

Compact three-phase motor HB and brake motor HBZ 13

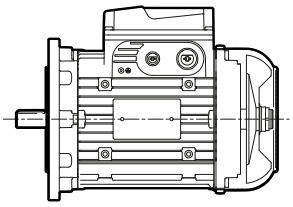
13.1

Compact asynchronous three-phase motor HB

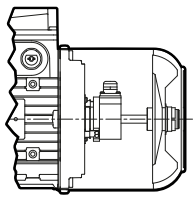
13.1.1 General specifications

- **insulation class F**, rise temperature B;
- **mating tolerances under «accuracy» rating;**
- **IP55 protection;**
- **suitable for operation with inverter;**
- asynchronous three-phase **electric motor** with rotor cage, total enclosed, externally ventilated (cooling system IC 411 with cooling fan keyed on motor shaft);
- **single-speed** 2, 4 or 6 poles **motor**;
- particularly strong **construction** (both electrical and mechanical); duly proportioned bearings;
- **«generous» electromagnetic sizing** having margins of safety, good acceleration capacity (high frequency of starting) and uniform starting (slightly «sagged» characteristic curves);
- **metallic terminal box;**
- **designs available** for every application need (independent cooling fan, independent cooling fan and encoder, protections higher than IP 55, etc.)

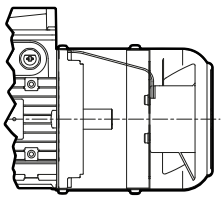
Standard



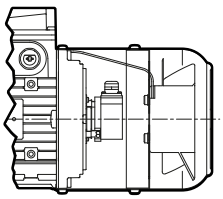
Encoder



Independent cooling fan



Independent cooling fan and encoder



UT.C 1374

Rated power delivered on continuous duty (S1) and referred to nominal voltage and frequency, ambient temperature -15 ÷ 40 °C and maximum altitude 1000 m.
Motor housing in pressure diecast light alloy.
Drive end and non-drive end end-shield in cast iron or light alloy.
«Supported» tightening attachments of **endshields and flanges** fitted on housing with «tight» coupling.
Ball bearings lubricated «for life» assuming pollution-free surroundings; preload spring.
Motor shaft axially fastened on drive end.
Rear threaded extraction hole as standard for sizes ≥ 90 ... 132.
Steel **fan cover**.
Thermoplastic **cooling fan** with radial vanes.
Terminal box made of light alloy (integral with housing with knockout cable openings on both sides, two holes, one for power cable and one for auxiliary equipment).
Left side position non drive end (pos. TB0 see page 40); on request other positions.
Pressure diecast light alloy **terminal box cover**.
Terminal block with 6 terminals (9 terminals for supply voltage YY230 Y460 60 Hz).
Earth terminal located inside terminal box; prearranged for the installation of further two external earth terminals on housing.

Rotor: pressure diecast cage rotor in aluminium.
Stator winding with class H copper conductor insulation, insulated with double coat, type of impregnation with resin of class H; other materials are of classes F and H for a class F insulation system.
Materials and type of impregnation allow use in tropical climates without further treatments.
Rotor dynamic balancing: vibration velocity under standard rating A. Motors are balanced with half key inserted into shaft extension.
Painting with bi-component water-based acrylic enamel, color blue RAL 5010 DIN 1843, suitable to resist to normal industrial environments (corrosivity class C3 ISO 12944-2).

For non-standard designs and accessories see page 41.

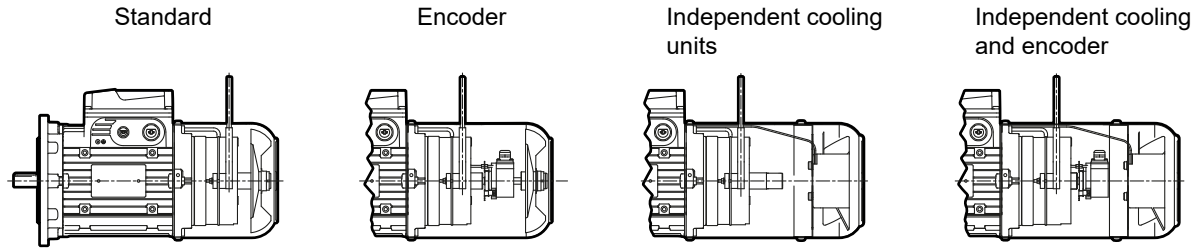
13.3.1 General specifications

- **Insulation class F**, rise temperature B;
- **mating tolerances under «accuracy» rating;**
- **IP55 protection;**
- **suitable for operation with inverter;**
- **electric asynchronous three-phase brake motor with d.c. brake** (braking in case of supply failure) with **double braking surface with braking torque proportioned to motor torque** (usually $M_f \approx 2\ M_N$);
- **single-speed** 2, 4 or 6, poles **motor**;
- **particularly strong construction** (both electrical and mechanical) to withstand alternating torsional and thermic stresses of starting and braking; duly proportioned bearings;
- **electromagnetic sizing especially studied** to allow high acceleration capacity (high frequency of starting) and uniform starting;
- **large metal terminal box**, multivoltage rectifier, one brake coil, for **voltage always coordinated** with the motor one (both Δ and Y);
- **maximum reduced noise level and operation progressivity** (both at starting and braking) thanks to a lower rapidity (typical of d.c. brake) of the anchor (which is lighter and less quick in the impact): motor starts slightly braked i.e. with greater progressivity; good release and braking rapidity; possibility to increase rapidity in braking, with supply opening on d.c. side;
- **high braking capacity;**
- **designs available** for every application need (independent cooling fan, independent cooling fan and encoder, protections higher than IP 55, etc.);
- **particularly suitable** for applications requiring **regular and low-noise starting and braking** and, at the same time, braking with good rapidity and precision and high number of starts.



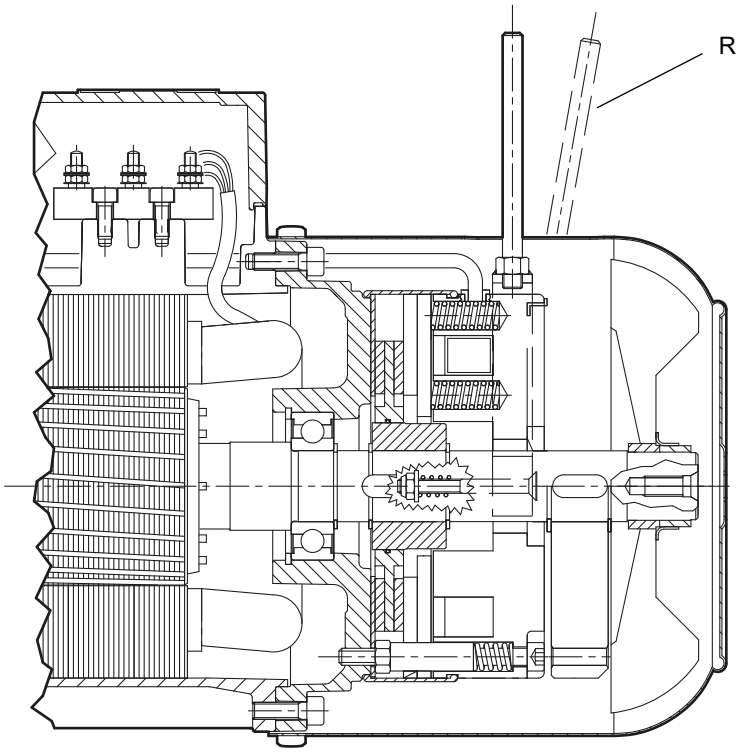
UT.C 1383

«Torque-speed» **characteristic curves** duly optimized for handling (horizontal and vertical traverse movements, rotation), slightly «sagged», without peaks in the hipersynchronous area and with carefully proportioned mean value.
Rated power delivered on continuous duty (S1) and referred to nominal voltage and frequency, ambient temperature -15 ÷ +40 °C and maximum altitude 1 000 m.
Housing in pressure diecast light alloy.
Drive end flange and non-drive end endshield in cast iron or light alloy.
«Supported» tightening attachments of **endshields and flanges** fitted on housing with «tight» coupling.
Ball bearings lubricated «for life» assuming pollution-free surroundings; preload spring.
Motor shaft in steel axially fastened on drive end endshield.
Rear threaded extraction **hole.**
Steel **fan cover**.
Thermoplastic **cooling fan** with radial vanes.

Terminal box made of light alloy (integral with housing with knockout cable openings on both sides, two holes, one for power cable and one for auxiliary equipment). Left side position non drive end (pos. TB0 see page 40); on request other positions. Pressure diecast light alloy **terminal box cover**.
Terminal block with 6 terminals (9 terminals for supply voltage YY230 Y460 60 Hz).
Earth terminal located inside terminal box; prearranged for the installation of further two external earth terminals on housing.
Brake supply: with rectifier laying in terminal box having 2 terminals for cable connection for rectifier supply, 2 for rapid braking external contact; possible brake supply **directly from motor terminal block** or **separately** (to use for: motors supplied by inverter, separate drive needs of motor and brake, etc.). Brake can be supplied, also at motor standstill, with no time limitations.
Rotor: pressure diecast cage rotor in aluminium.
Stator winding with class H copper conductor insulation, insulated with double coat, type of impregnation with resin of class H; other materials are of classes F and H for a class F insulation system.
Rotor **dynamic balancing**: vibration velocity under standard rating A. Motors are balanced with half key inserted into shaft extension.
Painting with two-component water based acrylic enamel, color blue RAL 5010 DIN 1843, suitable for normal industrial environments (corrosivity class C3 ISO 12944-2)

For **non-standard designs** and accessories see page 41.

13.3.2 Brake specifications



Electromagnetic spring loaded brake (braking occurs automatically when it is not supplied), with **d.c.** toroidal coil and double braking surface, braking torque proportioned to motor torque (usually $M_f \approx 2\ M_N$).
Maximum reduced noise level and operation progressivity (both at starting and braking thanks to a lower rapidity, typical of d.c. brake, of the anchor, which is lighter and less quick in the impact: motor starts slightly braked i.e. with greater progressivity); **good release and braking rapidity**; possibility to increase rapidity, both in releasing (with rapid rectifier) and braking, with supply opening on d.c. side; high braking capacity.
Designs available for every application (encoder, independent cooling fan, independent cooling fan and encoder, second shaft end, etc.).

Particularly suitable for applications requiring regular and low-noise starting and braking and, at the same time, braking with good rapidity and precision and high number of starts.
When electromagnet is not supplied, the brake anchor pushed by springs, presses the brake disk on rear end-shield generating the braking torque on the same brake disk and consequentely on motor shaft it is keyed onto; by supplying the brake the electromagnet draws the brake anchor and releases brake disk and driving shaft.

Key features:

- **multivoltage rectifier** (as standard), specifically designed for the management of a **brake coil only** with supply voltage always coordinated with standard voltage of HBZ motor (Δ 230 Y400 V ± 5% 50 Hz and accordingly also Δ 277 Y480 V ± 5% 60 Hz); **other voltages** on request;
- **rectifier supply directly from motor terminal block** or indifferently from a separate line;
- **braking torque** adjustable by changing number of springs;
- **insulation class F**, temperature rise class B;
- **brake disk**, sliding on moving hub: with single steel coat and double friction surface with average friction coefficient for low wear;
- **brake anchor in two pieces** for greater rapidity of starting and reduced noise;
- **water-proof and dust-proof gaiter and V-ring** both to prevent polluting infiltrations from surroundings towards brake, and to avoid that wear dust of friction surface will be dispersed in the surroundings;
- **lever for manual release with automatic return (as standard)** and removable level rod; position of release lever corresponding to terminal box; on request, other possible positions. Contact Rossi S.p.A.;
- **for other running specifications** see following table.

For **non-standard designs** and accessories see page 41.

Motor is always **equipped with a high reliable rectifier** fixed on terminal box providing adequate connecting terminal (2 for rectifier supply directly from motor terminal block or separate; 2 for external contact of rapid braking).

Multivoltage rectifiers **RM1**(1) (supplied as standard for brakes 12 ... 14) and **RM2**(1) (supplied as standard for brakes 05 ... 07) are a.c./d.c. supply voltage devices with full-wave controlled bridge able to **supply output voltage value independently from input voltage.**

The DC brake is suitable for power supply

range 110 ÷ 440 V a.c. (for brake sizes 12 ÷ 15)
range 200 ÷ 440 V a.c. (for brake sizes 06S ... 07)

without having to change the coil and therefore is also always coordinated with both motor voltages.
In the supply range 200 ÷ 440 V a.c., the rectifier also has an integrated speed-up function (a higher voltage than the nominal voltage is supplied to the brake coil for approx. 400 ms at the start, allowing the brake to be released more quickly).
In addition, compared to a conventional rectifier, multi-voltage also offers the following advantages:

- greater constancy of the brake performance (the output voltage being at a constant predefined value independent of fluctuations in the supply voltage);
- lower brake holding voltage (75 V d.c.) in the released state (lower power consumption, less coil heating and shorter braking delay).

Both models of rectifiers (RM1, RM2) can be switched on and off either on the a.c. side (for maximum quiet operation), or on the a.c. and d.c. sides. (for faster braking), as they are equipped with varistors to protect the diodes, the electromagnet and the d.c. side opening contact.

Main functional brake specifications

Actual values may deviate slightly depending on the ambient temperature and humidity, the brake temperature and the wear condition of the friction linings.

(1) The multivoltage rectifiers RM1 and RM2 are patented devices.
(2) Standard rectifier, supplied as standard; the rest time must be between 2.5 s ÷ 3.5 s. If necessary, please contact Rossi S.p.A.
(3) Values valid with M_{fmax}, mean air-gap, nominal value of supply voltage.
(4) Brake release time obtained with standard rectifier and, for RM1, with supply voltage 200 V c.a.
(5) Braking delay obtained with separate brake supply and disconnection on a.c. side of rectifier (t_2) or on a.c. and d.c. side. (t_2 *d.c*).
With direct supply from motor terminal block, the values of t_2 increase by approx. 2,5 times the ones stated in the table.
(6) Work of friction generating a brake disk wear of 1 mm. (minimum value for heavy application, real value is usually greater).
(7) Maximum brake disk wear.
(8) Maximum friction work for each braking.

Installation and maintenance

Section contents

14.1	Safety	224
14.2	Installation and maintenance	225

14.1

Safety

Important:
The gearmotors supplied by Rossi S.p.A. must be incorporated into machinery and **should not be commissioned before the machinery or system in which the components have been incorporated conforms to:**

- **Machinery directive 2006/42/EC and subsequent updatings; in particular, possible safety guards for shaft ends not being used and for eventually accessible fan cover passages (or other) are the Buyer's responsibility;**
- **«Electromagnetic compatibility (EMC)» 2004/108/EC and subsequent updatings.**

Attention!
It is recommended to pay attention to all instructions of present handbook, all existing safety laws and standards concerning correct installation. Whenever personal injury or property damage may occur, due to falling or projecting parts of gear reducer or of its parts, foresee adequate supplementary protection devices against loosening or breaking of the fastening screws.
If deviations from normal operation occur (temperature increase, vibrations, unusual noise, etc.) immediately switch off the machine.

Safety during installation
An incorrect installation, an improper use, the removing or disconnection of protection devices, the lack of inspections and maintenance, improper connections may cause severe personal injury or property damage.
Therefore the component must be moved, installed, commissioned, handled, controlled, serviced and re-paired **exclusively by responsible qualified personnel specifically instructed** and have the necessary experience to recognize any risks connected with present products avoiding any possible emergencies.

Gear reducers and gearmotors of present catalog are normally suitable for installations in industrial areas: additional protection measures, if necessary, must be adopted and assured by the personnel responsible for the installation.

Attention!
Motors in non-standard design or with constructive **variations** may differ in the details from the ones described here following and may require additional information.

Attention!
For the installation, use and maintenance of the electric motor of the possible motor-variator and/or the electric supply device (frequency converter, soft-start, etc.), and/or any optional electric devices (e.g.: independent cooling fan, etc.), consult the specific attached documentation. If necessary, require it.

Safety during maintenance
When operating on gear reducer or on components connected to it, the **machine must be at rest, disconnected from power supply and cold**: disconnect motor (including auxiliary equipments) from power supply, gear reducer from load, be sure that safety systems are on against any accidental starting and, if necessary, pre-arrange mechanical locking devices (to be removed before commissioning).

Attention!
During the running the gear reducers could have **hot surfaces**; Always wait that the gear reducer or the gearmotor to cool before carrying out any operations. Further technical documentation (e.g. catalogs) can be downloaded from our website **www.rossi.com**.

Be sure that the structure on which gearmotor is fitted is plane, levelled and sufficiently dimensioned in order to assure fitting stability and vibration absence, keeping in mind all transmitted forces due to the masses, to the torque, to the radial and axial loads.

Position the gearmotor so as to allow a free passage of air for cooling both gear reducer and motor (especially at motor fan side).

Avoid: any obstruction to the air-flow; heat sources near the gearmotor that might affect the temperature of cooling-air and of gearmotor for radiation; insufficient air recycle or any other factor hindering the steady dissipation of heat.
Mount the gearmotor so as not to receive vibrations.

When external loads are present use pins or locking blocks, if necessary.

When fitting gear reducer and machine and/or gear reducer and eventual flange B5 it is recommended to use **locking adhesives** such as LOCTITE on the fastening screws (also on flange mating surfaces).
For outdoor installation or in a hostile environment protect the gearmotor with anticorrosion paint. Added protection may be afforded by water-repellent grease (especially around the rotary seating of seal rings and the accessible zones of shaft end).

Gearmotors should be protected wherever possible, and by whatever appropriate means, from solar radiation and extremes of weather; weather protection **becomes essential** when the low or high speed shafts or when motor is vertical with fan on the top.

For ambient temperatures higher than 40 °C or lower than 0 °C, contact Rossi S.p.A.

Before wiring-up the gearmotor, make sure that motor voltage corresponds to input voltage.
If direction of rotation is not as desired, invert two phases at the terminals.

If overloads are imposed for long periods or if shocks or danger of jamming are envisaged, then motor-protection, electronic torque limiters, fluid couplings, safety couplings, control units or other similar devices should be fitted.
Where duty cycles involve a high number of starts on-load, it is advisable to utilize **thermal probes** (fitted on the wiring) for motor protection; a thermal overload relay is unsuitable since its threshold must be set higher than the motor's nominal current rating.

Use varistors to limit voltage peaks due to contactors.

Attention!
Bearing life and good shaft and coupling running depend on alignment precision between the shafts.
Carefully align the gearmotor with the driven machine (with the aid of shims if need be), interposing flexible couplings whenever possible.
Whenever a leakage of lubricant could cause heavy damages, increase the frequency of inspections and/or envisage appropriate control devices (e.g.: remote oil level gauge, lubricant for food industry, etc.).

In polluting surroundings, take suitable precautions against lubricant contamination through seal rings or other.

For brake or non-standard motors, consult us for specific information.

Fitting of components to low speed shaft ends
It is recommended that the bore of parts keyed to low speed shaft ends is machined to K7 tolerance (H7 when load is uniform and light).
Before mounting, thoroughly clean mating surfaces and lubricate against seizure and fretting corrosion. Installing and removal operations should be carried out with pullers and jacking screws using the tapped hole at the shaft butt-end.

Machine pivot
For the machine pivot the gear reducer hollow shaft is to be keyed onto we recommend the dimensions stated on page 12.

Gear selection data sheet

1 Application conditions

Application / Industry sector

Type of machine to be driven

- ☐ new machine
- ☐ existing machine, running gear reducer currently applied

Ambient temperature [°C]

min | standard | max

Altitude [m above sea level]

Environment:

- ☐ normal (industrial) indoor
- ☐ normal (industrial) outdoor
- ☐ dusty
- ☐ corrosive / humid

Gear reducer position:

- ☐ small environment with limited air movement (v_{air} < 0,63 m/s)
- ☐ wide environment with free air movement (v_{air} > 1,25 m/s)
- ☐ open space, protected against extremes of weather and solar radiance

2 Load data

Required output speed [min^{-1}]

min | nominal | max

Torque required at low speed shaft [N m]

min | nominal | max

Required output power [kW]

min | nominal | max

Input speed (gear reducers) [min^{-1}]

min | nominal | max

Nature of load:

- ☐ uniform
- ☐ moderate overloads
- ☐ heavy overloads

Frequency of starting [starts/h]

Machine moment of inertia [kg m^2]

min | standard | max

Running time [h/d]

Total duration [h]

Duty cycle (S1 ... S10)

Load cycle attached

- ☐ yes
- ☐ no

3 Motor

Motor type:

- ☐ asynchronous three-phase (a.c.)
- ☐ asynchronous three-phase with inverter
- ☐ d.c. motor with relevant converter
- ☐ internal combustion motor (single-cylinder)
- ☐ internal combustion motor (multi-cylinder)

Power P_1 [kW]

min | nominal | max

Nominal speed n_1 [min^{-1}]

min | nominal | max

a.c. motor supply:

voltage [V] | frequency [Hz]

IEC motor size (a.c. motor)

Type of a.c. motor starting:

- ☐ direct
- ☐ Y / Δ
- ☐ soft starter / inverter

Electromagnetic motor

- ☐ parking brake
- ☐ work
- ☐ safety

Braking torque [N m]

Starting torque [N m]

Moment of inertia [kg m^2]

Electric motor design (a.c. and d.c.):

- ☐ with independent cooling fan
- ☐ with encoder:
- ☐ with tacho-generator

System of motor-gear reducer mounting:

- ☐ with coupling
- ☐ with trapezoidal belts

section | No. | d_m [mm] | d_1 [mm]

- ☐ with toothed belt drive

section | No. | d_m [mm]

Eventual limit to drive dimensions

4 Gear reducer

Mounting position

Direction of rotation of output shaft

- ☐ white arrow
- ☐ black arrow
- ☐ white and black arrow

Backstop device (if present)

- ☐ free rotation, white arrow
- ☐ free rotation, black arrow

Type of admitted cooling

- ☐ with fan
- ☐ with coil
- ☐ with internal exchanger
- ☐ with UR O/A unit
- ☐ with UR O/W unit

Type of machine coupling

- ☐ shaft mounting
- ☐ with fluid / flexible coupling
- ☐ with cardan joint
- ☐ with toothed belt drive

pitch | d_m | d_1 | ϕ

- ☐ with chain

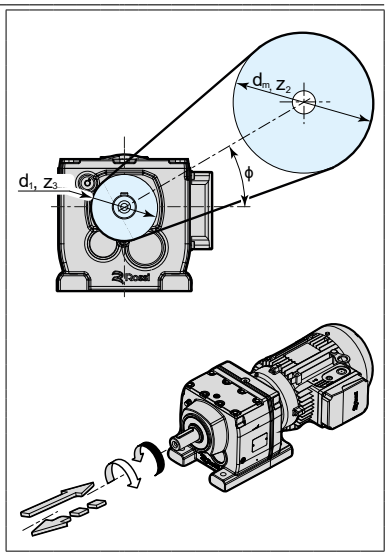
pitch | No. | z_2 | z_3 | overhang [mm] | ϕ

- ☐ straight tooth cylindrical gear

pitch | No. | z_2 | z_3 | overhang [mm] | ϕ

Eventual axial load F_a [N]

Eventual limit to drive dimensions



Frame size	With Technical System units	With SI units
starting or stopping **time** as a function of an acceleration or deceleration, of a starting or braking torque	$t = \frac{v}{a}$ [s] $t = \frac{Gd^2 \cdot n}{375 \cdot M}$ [s]	$t = \frac{J \cdot \omega}{M}$ [s]
velocity in rotary motion	$v = \frac{\pi \cdot d \cdot n}{60} = \frac{d \cdot n}{19,1}$ [m/s]	$v = \omega \cdot r$ [m/s]
angular velocity	$n = \frac{60 \cdot v}{\pi \cdot d} = \frac{19,1 \cdot v}{d}$ [min^{-1}]	$\omega = \frac{v}{r}$ [rad/s]
acceleration or deceleration as a function of starting or stopping time	$a = \frac{v}{t}$ [m/s^2]	
angular **acceleration** or **deceleration** as a function of a starting or stopping time, of a starting or braking torque	$\alpha = \frac{n}{9,55 \cdot t}$ [rad/s^2] $\alpha = \frac{39,2 \cdot M}{Gd^2}$ [rad/s^2]	$\alpha = \frac{\omega}{t}$ [rad/s^2] $\alpha = \frac{M}{J}$ [rad/s^2]
starting or stopping distance as a function of an **acceleration** or deceleration, of a final or initial velocity	$s = \frac{a \cdot t^2}{2}$ [m] $s = \frac{v \cdot t}{2}$ [m] $w = \frac{\alpha \cdot t^2}{2}$ [rad]	
starting or stopping **angle** as a function of an angular acceleration or deceleration, of a final or initial angular velocity	$\varphi = \frac{n \cdot t}{19,1}$ [rad]	$\varphi = \frac{\omega \cdot t}{2}$ [rad]
mass	$m = \frac{G}{g}$ $[\frac{\text{kgf s}^2}{\text{m}}]$	m è l'unità di massa [kg]
weight (weight force)	G è l'unità di peso (forza peso) [kgf]	$G = m \cdot g$ [N]
force in vertical (lifting), horizontal, inclined motion of translation (μ = coefficient of friction; φ = angle of inclination)	$F = G$ [kgf] $F = \mu \cdot G$ [kgf] $F = G\ (\mu \cdot \cos\varphi + \text{sen}\ \varphi)$ [kgf]	$F = m \cdot g$ [N] $F = \mu \cdot m \cdot g$ [N] $F = m \cdot g\ (\mu \cdot \cos\varphi + \text{sen}\ \varphi)$ [N]
dynamic moment Gd², moment of inertia J due to a motion of translation (numerically $J = \frac{Gd^2}{4}$)	$Gd^2 = \frac{365 \cdot G \cdot v^2}{n^2}$ [kgf m^2]	$J = \frac{m \cdot v^2}{\omega^2}$ [kg m^2]
torque as a function of a force, of a dynamic moment or of a moment of inertia, of a power	$M = \frac{F \cdot d}{2}$ [kgf m] $M = \frac{Gd^2 \cdot n}{375 \cdot t}$ [kgf m] $M = \frac{716 \cdot P}{n}$ [kgf m]	$M = F \cdot r$ [N m] $M = \frac{J \cdot \omega}{t}$ [N m] $M = \frac{P}{\omega}$ [N m]
work, energy in motion of translation, in rotary motion	$W = \frac{G \cdot v^2}{19,6}$ [kgf m] $W = \frac{Gd^2 \cdot n^2}{7160}$ [kgf m]	$W = \frac{m \cdot v^2}{2}$ [J] $W = \frac{J \cdot \omega^2}{2}$ [J]
power in motion of translation, in rotary motion	$P = \frac{F \cdot v}{75}$ [CV] $P = \frac{M \cdot n}{716}$ [CV]	$P = F \cdot v$ [W] $P = M \cdot \omega$ [W]
power available at the shaft of a single-phase motor ($\cos\varphi$ = power factor)	$P = \frac{U \cdot I \cdot \eta \cdot \cos\varphi}{736}$ [CV]	$P = U \cdot I \cdot \eta \cdot \cos\varphi$ [W]
power available at the shaft of a three-phase motor	$P = \frac{U \cdot I \cdot \eta \cdot \cos\varphi}{425}$ [CV]	$P = 1,73 \cdot U \cdot I \cdot \eta \cdot \cos\varphi$ [W]

Note. Acceleration or deceleration are understood constant; motion of translation and rotary motion are understood rectilinear and circular respectively.
