HOW SMART GUIDE® CATALOG WORKS

www.SystemPlastSmartGuide.com

The page codes of this catalog opens your access to all relevant information and services about the product you have selected on www.SystemPlastSmartGuide.com

30050a
www.SystemPlastSmartGuide.com

- Related information:
- Construction details
 - Applications
 - Inspections and maintenance
 - Materials and calculations

Clicking on product code directly available:

- Download DWG and STP files
- Possibility to create your bill of material for enquiry or purchase

SPEC®
Load and strength calculator

Our interactive catalog is your key to direct access to the System Plast® SmartGuide® website, where you will find all possible information and tools to assist you in selecting, applying our products

(SPEED-LINE) STRAIGHT RUNNING CHAINS - STAINLESS STEEL

**HIGH PERFORMANCE
EXTENDED LIFE**

Information about this product is only available on our Smart Guide® website.

EXTRA PLUS HB
Vacuum hardened stainless steel pins

page code:
73560a

11040a

Other versions 815:
VG Rubber top

Standard versions: **11030a**

For versions in austenitic and carbon steel material: **11030b**

Advantages:

- The best choice for the most demanding applications, like pressureless combiners and high speed applications.
- Improved flatness.
- Optimum product stability.

FOR CHAINS 812-815 (VG)-881 (M-MO-TAB-VG)-8157 (VG)-8857TAB

New design
30990a

Features:

- Very high strength.
- Split versions: quick and easy replacement.
- Foolproof design.
- Completely closed structure, easy to clean and to disinfect.
- Excellent wear and chemical resistance.
- Recyclable.

881M - 881MO

www.SystemPlastSmartGuide.com

SIDEFLEXING CHAINS FOR MAGNETIC SYSTEM

Characteristics:

- The chains series 881 M and 8857 M are securely retained in the curve by magnets located under the hinge of the chain in the upper part of curve. As there are no TAB or BEVEL shoes on these chains they can be easily removed from the curve for maintenance or for cleaning, without dismantling the chain.
- The enlarged surface of our 881 MO series offers improved product support compared to the 881 M series.

Advantages:

- Optimum flatness of chains in curves
- Less power consumption
- For high speed lines
- Best product transfer along as well as across the running direction
- All advantages of the magnetic system
- The best choice for the most demanding applications, like pressureless combiners and high speed applications
- Improved flatness
- Optimum product stability

Pin Material: Ferritic Stainless Steel.

Information about this product is only available on our Smart Guide® website.

881R TAB - 8810 TAB

SIDEFLEXING CHAINS FOR TAB SYSTEM

8810 chain utilizes an optimized hinge versus previous 881 design for better product handling. 8810 uses the same sprockets and wear track as 881 but the two are not able to be linked together due to different link design.

8810 TAB Optimized hinge shape

SIDEFLEXING PLATE TOP CHAINS WITH BASE ROLLER CHAINS (PITCH 3/4" - 19,05 mm)

Advantages:

- High speed
- Very high loads
- Longer conveyors
- Flights removable
- Lower noise
- No chain elongation

STRAIGHT RUNNING CHAINS

New
NG evo

NG® evo conveyor components made from engineered plastic resin
 Longer wearlife than acetal
 Lower friction than acetal
 Good chemical resistance
 High abrasion resistance
 It meets the requirement for materials as stated by EC1935/2004 and FDA CFR21 norms for direct food contact
 Less dust than with acetal chains
 More.....

820 - 820P

831

Top plate thickness 4,8 mm

Other versions 831:

VG
Rubber top

LBP
(low pressure)

TRAVEL →

Note:

The 831 series has a top plate of 4,8 mm giving long wear life.
 It also simplifies conveyor design when matching chains from the series 821 879 - 882 - 8257 - 882 M.

Pin material:

Austenitic steel (SPM) or plastic pin (PPM).

 More.....

Characteristics:

The new 878 TAB series enables the designer and the manufacturer of sideflexing conveyors to reduce the radius of the curves. This chain is suitable for solving conveying problems in confined spaces. Can also be used where products are conveyed on an incline or decline and accumulation may occur. The characteristics of this chain make this product unique in its design.

Pin material: Austenitic steel.

Advantages:

- Small sideflexing radius R=190 mm (877 TAB and 878 TAB only).
- Tangential engagement.
- Specially shaped flights to improve the contact between the product and chain.
- Small gap between flights for high product stability.

Nolu®-S curves are strongly recommended with these chains!

Note:

The 879 TAB series has a top plate of 4,8 mm giving long wear life. It also simplifies conveyor design when matching chains from the series 821, 831, 8257 and 882.

Pin material: Austenitic steel

The use of tangential sprockets and turning disks enables the design of compact conveying systems with a great number of curves. It becomes easy to realise circuits either on the same level or staggered, inclined or downclined.

882 BEVEL - 882 TAB SIDEFLEXING CHAINS

NG® evo conveyor components made from engineered plastic resin
 Longer wearlife than acetal
 Lower friction than acetal
 Good chemical resistance
 High abrasion resistance
 It meets the requirement for materials as stated by EC1935/2004 and FDA CFR21 norms for direct food contact
 Less dust than with acetal chains
 More.....

Nolu®-S curves are strongly recommended with these chains!

Characteristics:

The 882 BEVEL and TAB types have a larger hinge geometry and because of a well balanced distribution of the material they have an excellent carrying load capacity.

Advantages: Heavy duty.

Pin material: Austenitic steel.

STRAIGHT RUNNING CHAINS HEAVY DUTY SINGLE HINGE

NG® evo conveyor components
made from engineered plastic resin
 Longer wearlife than acetal
 Lower friction than acetal
 Good chemical resistance
 High abrasion resistance
 It meets the requirement for materials as stated by EC1935/2004 and FDA CFR21 norms for direct food contact
 Less dust than with acetal chains
 More.....

Advantages:

- High strength
- Helps standardising your conveyor constructions
- Same hinge width available in many chain types, both steel and plastic, also LBP chains and rubber top chains

Pin material: Austenitic steel

STRAIGHT RUNNING CHAINS WITH HIGH FRICTION SURFACE

NG®evo conveyor components made from engineered plastic resin
 Longer wearlife than acetal
 Lower friction than acetal
 Good chemical resistance
 High abrasion resistance
 It meets the requirement for materials as stated by EC1935/2004 and FDA CFR21 norms for direct food contact
 Less dust than with acetal chains
 More.....

Other versions 831:

FT
Flat top

LBP
(low pressure)

Pin material: Austenitic steel

SIDEFLEXING CHAINS WITH HIGH FRICTION SURFACE FOR MAGNETIC CURVES

NG® evo conveyor components made from engineered plastic resin

- Longer wearlife than acetal
- Lower friction than acetal
- Good chemical resistance
- High abrasion resistance
- It meets the requirement for materials as stated by EC1935/2004 and FDA CFR21 norms for direct food contact
- Less dust than with acetal chains
- More.....

Advantages:

- High breaking load
- Helps standardising your conveyor constructions
- Same hinge width available in many chain types, both steel and plastic, also LBP chains and flat top chains

Note:

Plastic magnetic system chains do not have tabs or bevels; it is the Stainless Steel pin in the chain which is attracted by the magnets embedded in the curve.

Pin material: Ferritic Stainless Steel

Other versions
 1873 TAB:

FT
Flat top

GS
Gripper

VG
Rubber top

Advantages:

- High speed
- Very high loads
- Longer conveyors
- Easy maintenance
- Removable flights
- Lower noise
- No chain elongation
- The special design allows for gentle bottling handling while avoiding extra pressure on the product, preventing bottle distortion
- The design of the rubber top provides stable support for the bottle
- Flexibility of the chain for compact design if required
- Special heat resistant rubber, 85 Shore A
- Plate in low-friction NGE material
- Flexible base chain, can twist 90° in 1500 mm (60-in)
- Metal base chain provides increased strength

Application Example:

Note:

ANSI 60 roller chain.

SIDEFLEXING PLASTIC PLATE TOP CHAINS WITH SNAP ON GRIPPER

50160a

Application:

Elevating and lowering conveyors.

Characteristics:

Gripper pads are utilized for a wide range of applications due to their unique mechanical properties. They offer users high laceration and abrasion resistance, good resistance to deformation and excellent resistance to fatigue and heat.

Note:

ANSI 60 roller chain

STRAIGHT RUNNING PLATE TOP CHAINS WITH BASE ROLLER (PITCH 1/2" - 12,7 mm)

Advantages:

- High speed
- Low noise
- Small pitch
- Reduced chordal effect
- Reduced sprocket diameter
- Easy maintenance
- Plastic flights removable
- High loads

Note: ANSI 40 roller chain

863 STRAIGHT RUNNING PLATE TOP CHAINS WITH BASE ROLLER (PITCH 3/4" - 19,05 mm)

Descriptions:

Combining the carrying capacity of a high quality base roller chain with the smoothness and flatness of the thermoplastic flights, allows for greater conveyor design freedom with these chains, increased conveyor lengths and faster speeds are possible.

Note: ANSI 60 roller chain

NG® *evo* conveyor components made from engineered plastic resin

- Longer wearlife than acetal
- Lower friction than acetal
- Good chemical resistance
- High abrasion resistance
- It meets the requirement for materials as stated by EC1935/2004 and FDA CFR21 norms for direct food contact
- Less dust than with acetal chains
- More.....

Backflex radius: 10 mm (0.39 in)

Max load capacity: 2500 N/m (1845 lbs/ft.)

Weight: 5,5 Kg/m² (1.12 lbs/ft².)

Pin material: PBT (white)

Standard length:

width ≤ 15 in: 3,040m (380 rows)

width > 15 in ≤ 66 in: 1,520m (190 rows)

width > 66 in: on request

Single track

NG® evo conveyor components made from engineered plastic resin

- Longer wearlife than acetal
- Lower friction than acetal
- Good chemical resistance
- High abrasion resistance

It meets the requirement for materials as stated by EC1935/2004 and FDA CFR21 norms for direct food contact

Less dust than with acetal chains

More.....

Pin material: PBT (white)

12,7 mm (½") MODULAR BELTS 2120

FLUSH GRID VERSION - 85 mm (3.35 in) MODULES

NG® evo conveyor components
 made from engineered plastic resin
 Longer wearlife than acetal
 Lower friction than acetal
 Good chemical resistance
 High abrasion resistance
 It meets the requirement for materials as stated by EC1935/2004 and FDA CFR21 norms for direct food contact
 Less dust than with acetal chains
 More.....

Backflex radius: 10 mm (0.39 in)
Max load capacity (LFG & LFB): 20000 N/m (1400 lbs/ft.)
Weight: 7,4 Kg/m² (1.51 lbs/ft².)
Pin material: PBT (white)
Standard length:
 width ≤ 340 mm (13.39 in) : 3,048 m (10 ft.)
 width > 340 mm (13.39 in) ≤ 1700 mm (66.93 in) : 1,524 m (5 ft.)
 width > 1700 mm (66.93 in) : on request
Open surface: 21%
 Can be used with a Nose bar to create extremely short transfers.

12,7 mm (½") MODULAR BELTS RUBBER INSERT EVERY 2nd & 3th PITCH

NG® evo conveyor components made from engineered plastic resin

- Longer wearlife than acetal
- Lower friction than acetal
- Good chemical resistance
- High abrasion resistance
- It meets the requirement for materials as stated by EC1935/2004 and FDA CFR21 norms for direct food contact
- Less dust than with acetal chains
- More.....

Belt material: grey blue colour

Rubber material: thermoplastic rubber, black colour, 50 shore A.

Backflex radius: 20 mm (0.8 in)

Max load capacity: 18000 N/m (1260 lbs/ft.)

Pin material: PBT (white)

Standard length:

- width ≤ 340 mm (13.39 in): 3,048 m (10 ft.)
- width > 340 mm (13.39 in) ≤ 1700 mm (66.93 in): 1,524 m (5 ft.)
- width > 1700 mm (66.93 in): on request

Can be used with a Nose bar to create extremely short transfers.

12,7 mm (½") MODULAR BELTS 2120 GB

VERSION WITH GUIDE BAR ON 2nd & 3th PITCH FOR TRANSFER

NG® evo conveyor components
made from engineered plastic resin
Longer wearlife than acetal
Lower friction than acetal
Good chemical resistance
High abrasion resistance
It meets the requirement for materials as stated by EC1935/2004 and FDA CFR21 norms for direct food contact
Less dust than with acetal chains
More.....

Belt material: grey blue colour
Backflex radius: 20 mm (0.79 in)
Max load capacity: 18000 N/m (1260 lbs/ft.)
Pin material: PBT (white)
Standard length:
width ≤ 340 mm (13.39 in): 3,048 m (10 ft.)
width > 340 mm (13.39 in) ≤ 1700 mm (66.93 in) : 1,524 m (5 ft.)
width > 1700 mm (66.93 in): on request

Can be used with a Nose bar to create extremely short transfers.

page code: **30175a**

Information about this product is only available on our Smart Guide® website.

DRIVE AND RETURN SPROCKETS

www.SystemPlastSmartGuide.com

FOR BELTS 2120 - 2120M - 2121

FOR 2120 - 2121-2122

MOLDED DRIVE SPROCKETS SQUARE BORE ONE PIECE - FLOATING		
Z	∅ 30X30	∅ 40X40
ITEM DESCRIPTION		
24	2120-24S30M-D	2120-24S40M-D

Material: reinforced polyamide (grey).

Z	Ø OD mm	Ø P mm	S mm
24	97,3	96,5	44,14
28	113,3	112,5	52,15
36	145,4	144,6	68,28

Notes:

Sprockets with 'fixed' bores (standard split types) do not follow the expansion or contraction of a belt and therefore can be used only for belts widths up to 680 mm (27-in) and temperature differences of maximum 30°C (86°F).

For all other applications we recommend using floating sprockets. Sprockets that normally have a 'fixed' or 'tight' bore can be made 'floating' on request. In that case just add the letter P to the standard item description.

For example, code **2120-24R30M-DPS**

Set collars, go to:

5 4 6 3 0 a

Sprockets with 'tight' bores (standard one piece types) can be a cost effective solution for many applications; but if the belt is wider than 680 mm and large temperature fluctuations (> 30°C - 86°F) occur, we recommend using the floating versions. 'Tight' and 'floating' bore sprockets are recommended to be kept in position with set collars or with help of the positioners of the belt.

New design

3 0 9 9 5 a

Features:

- New design with snap-assembly system included.
- Very high strength.
- Split versions: quick and easy replacement.
- Foolproof design.
- Excellent wear and chemical resistance.
- Recyclable.

NOT SUITABLE FOR 2122 FG !

DRIVE AND RETURN SPROCKETS

www.SystemPlastSmartGuide.com

FOR BELT 2190

Note:

Sprockets with 'fixed' bores (standard split types) do not follow the expansion or contraction of a belt and therefore can be used only for belts widths up to 680 mm (27-in) and temperature differences of maximum 30°C (86°F).

For all other applications we recommend using floating sprockets. Sprockets that normally have a 'fixed' or 'tight' bore can be made 'floating' on request. In that case just add the letter P to the standard item description.

For example, code **2190-17R25M-DPMS**

Sprockets with 'tight' bores (standard one piece types) can be a cost effective solution for many applications, but if the belt is wider than 680 mm (27-in) and large temperature fluctuations (> 30°C - 86°F) occur, we recommend using the floating versions. 'Tight' and 'floating' bore sprockets are recommended to be kept in position with set collars or with help of the positioners of the belt.

New design

30990a

Features:

- Very high strength.
- Split versions: quick and easy replacement.
- Foolproof design.
- Completely closed structure, easy to clean and to disinfect.
- Excellent wear and chemical resistance.
- Recyclable.

FLAT TOP VERSION

NG® evo conveyor components
made from engineered plastic resin
 Longer wearlife than acetal
 Lower friction than acetal
 Good chemical resistance
 High abrasion resistance
 It meets the requirement for materials as stated by EC1935/2004 and FDA CFR21 norms for direct food contact
 Less dust than with acetal chains
 More.....

Backflex radius: 25 mm (0.98 in)
Max load capacity (LFG & LFB): 25000 N/m (1700 lbs/ft.)
Weight: 7,4 Kg/m² (1.51 lbs/ft.²)
Pin material: PBT (white)
Standard length:

2250FG- K330

2250FG-PT-K330

NG® evo conveyor components made from engineered plastic resin
 Longer wearlife than acetal
 Lower friction than acetal
 Good chemical resistance
 High abrasion resistance
 It meets the requirement for materials as stated by EC1935/2004 and FDA CFR21 norms for direct food contact
 Less dust than with acetal chains
 More.....

Pin material: PBT (white)
Open surface: 23%

25,4 mm (1") 2250 MODULAR BELTS WITH FLIGHTS

www.SystemPlastSmartGuide.com

2250 FT

2250 FG

FLAT TOP

FLUSH GRID

continue ▶

Example modules:

3 in (76,2 mm) height

2 in (50,8 mm) height

1 in (25,4 mm) height

17 mm (0.67 in) side indent

34 mm (1.34 in) side indent

51 mm (2 in) side indent

Our 2250 series modular plastic belts can now be equipped with flights to convey products up an incline. The flights can be integrated into flat top or flush grid belts and can be made in different FDA approved materials and in different colors.

The height of the flights is 2 in, but also 1 in and 3 in height can be molded. The molded quality guarantees a smooth and hygienic product. It is easy to clean.

In order to facilitate a proper support of the belts in the return part of the conveyor, a belt can be made with side indents on the flights. The side indent can be 17, 34 or 51 mm with 51 mm being the standard indent. For wider belts it is even possible to have 1, 2 or 3 notches in between the flights.

The distance between 2 rows of flights can be made as required. You can just indicate the pitch between the rows that carry the flights.

25,4 mm (1") 2250 MODULAR BELTS - THICKNESS: 8,7 mm (0.34 in)

RUBBER INSERT EVERY PITCH

www.SystemPlastSmartGuide.com

Belt material: low friction acetal resin, grey colour
Rubber material: thermoplastic rubber, waterblue colour, 70 shore A.
Backflex radius: 30 mm (1.18 in)
Max load capacity: 25000 N/m (1700 lbs/ft.)
Pin material: PBT (white)
Standard length:
width ≤ 340 mm (13.39 in): 3,048 m (10 ft.)
width > 340 mm (13.39 in) ≤ 1700 mm (66.93 in): 1,524 m (5 ft.)
width > 1700 mm (66.93 in): on request

25,4 mm (1") 2250 MODULAR BELTS - THICKNESS: 8,7 mm (0.34 in)

RUBBER INSERT EVERY 2nd & 3th PITCH WITH SIDE INDENT

www.SystemPlastSmartGuide.com

Version with side indent

Belt material: low friction acetal resin, grey colour

Rubber material: thermoplastic rubber, waterblue colour, 70 shore A.

Backflex radius: 30 mm (1.18 in)

Max load capacity: 25000 N/m (1700 lbs/ft.)

Pin material: PBT (white)

Standard length:

width ≤ 340 mm (13.39 in): 3,048 m (10 ft.)

width > 340 mm (13.39 in) ≤ 1700 mm (66.93 in): 1,524 m (5 ft.)

width > 1700 mm (66.93 in): on request

DRIVE AND RETURN SPROCKETS

FOR BELTS 2250 - 2253FT - 2253RTC

Notes:

• Sprockets with single keyway can be used for belt widths up to 680 mm (27-in) and temperature differences of maximum 30°C (86°F).

• For wider belts or bigger temperature differences, sprockets with square bores or round bore with double keyway have to be used.

Drive sprockets are manufactured for a tight fit on the shaft.

To order single keyway sprockets capable of floating freely on the shaft, just add the letter "P" (=plus) to the existing Item description.

For example, item description **2250-14R30M-DPS**

Z	Ø OD mm	Ø P mm	S mm

◀ back

Double speed

When the belt is moving and the rollers are in contact with a fixed support area, the rollers will start rotating. This will result in movement of the product with a speed that is twice the speed of the belt. This function is very useful when products must be separated from each other.

This function enables the belt to run at lower speed, and that improves belt life and reduces energy consumption.

Rotation with product moving

When two parallel running belts are positioned underneath the roller top belts, and running in different directions, containers in the middle of the belt will rotate. This condition is ideal for applications where product orientation is important, for example, the infeed to a palletizer. In this case, containers can be moving forward while rotating.

Rotation with product stopped

When using a rotating disc underneath the roller top belt, you can have optimum control of the rotation of the product.

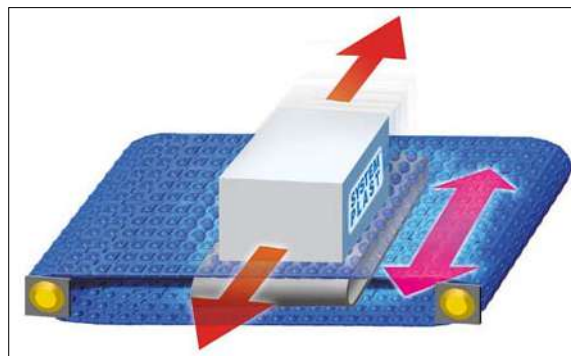

The roller top belt must be stopped during rotation.

Lateral movement

With a secondary activated belt positioned 90 degrees to the travel direction of the roller top belt, the system can transfer your package without external guides. This scenario is ideal for reject conveyors or any application requiring rapid 90 degree transfer of the conveyed item.

Product positioning can also be achieved by this configuration.

NG® evo conveyor components made from engineered plastic resin
 Longer wearlife than acetal
 Lower friction than acetal
 Good chemical resistance
 High abrasion resistance
 It meets the requirement for materials as stated by EC1935/2004 and FDA CFR21 norms for direct food contact
 Less dust than with acetal chains
 More.....

Backflex radius: 40 mm (1.58 in)
Max load capacity: 25000 N/m (1700 lbs/ft.)
Weight: 7,3 Kg/m² (1.49 lbs/ft.²)
Standard pin material: PBT (white)
Standard length:
 width ≤ 15 in: 3,048 m (10 ft.)
 width > 15 in ≤ 66 in: 1,524 m (5 ft.)
 width > 66 in: on request

RUBBER INSERT EVERY PITCH

Belt material: low friction acetal resin, grey colour
Rubber material: thermoplastic rubber, waterblue colour, 70 shore A.
Backflex radius: 30 mm (1.18 in)
Max load capacity: 38000 N/m (2600 lbs/ft.)
Pin material: PBT (white)
Standard length:
width ≤ 340 mm (13.39 in): 3,048 m (10 ft.)
width > 340 mm (13.39 in) ≤ 935 mm (36.81 in): 1,524 m (5 ft.)
width > 935 mm (36.81 in): on request

25,4 mm (1") MODULAR BELTS - THICKNESS: 12,7 mm (½")

RUBBER INSERT EVERY 2ND & 3TH PITCH WITH SIDE INDENT

www.SystemPlastSmartGuide.com

VERSION WITH SIDE INDENT

Belt material: low friction acetal resin, grey colour

Rubber material: thermoplastic rubber, waterblue colour, 70 shore A.

Backflex radius: 30 mm (1.18 in)

Max load capacity: 38000 N/m (2600 lbs/ft.)

Pin material: PBT (white)

Standard length:

width ≤ 340 mm (13.39 in): 3,048 m (10 ft.)

width > 340 mm (13.39 in) ≤ 935 mm (36.81 in): 1,524 m (5 ft.)

width > 935 mm (36.81 in): on request

LOW NOISE ACCUMULATION ROLLERS

www.SystemPlastSmartGuide.com

NG® EVO conveyor components made from engineered plastic resin

- Longer wearlife than acetal
- Lower friction than acetal
- Good chemical resistance
- High abrasion resistance
- It meets the requirement for materials as stated by EC1935/2004 and FDA CFR21 norms for direct food contact
- Less dust than with acetal chains
- More.....

Backflex radius: 120 mm (4.72 in)

Max load capacity: 34200 N/m (2340 lbs/ft.)

Weight: 28,8 Kg/m² (5.88 lbs/ft².)

Pin material: PBT (white)

Roller shaft material: Stainless Steel AISI 304

Standard length:

width ≤ 340 mm (13.39 in): 1,524 m (5 ft.)

width > 340 mm (13.39 in) ≤ 935 mm (36.81 in): 0,762 m (0.03 in)

DRIVE AND RETURN SPROCKETS

FOR BELTS 2251-2252

www.SystemPlastSmartGuide.com

Notes:

- Sprockets with single keyway can be used for belt widths up to 680 mm (27-in) and temperature differences of maximum 30°C (86°F).
- For wider belts or bigger temperature differences, sprockets with square bores or round bore with double keyway have to be used.

Drive sprockets are manufactured for a tight fit on the shaft. To order single keyway sprockets capable of floating freely on the shaft, just add the letter "P" (=plus) to the existing Item description. For example, **2251-14R30M-DPS**

Features:

- Split versions: quick and easy replacement.
- Foolproof design.
- Excellent wear and chemical resistance.
- Recyclable.

Information about this product is only available on our Smart Guide® website.

Material: LFG - Acetal, Grey.

PAB - Reinforced polyamide, black

Note:

- Use shouldered screws (included) for fixing the comb to the conveyor construction.

- Two caps are supplied with each comb to cover the long holes.

Material: stainless steel.

Shoulder screws are designed to fix the combs to the conveyor construction, but still allow for horizontal movement of the combs. This is required to follow expansion and contraction of the belt. Please consult Technical Support for optimum positioning of the screws.

DRIVE SPROCKETS

FOR BELT 2508

www.SystemPlastSmartGuide.com

The sprockets for 2508 series have a polygonal shape to provide optimum belt support. This is important for belts that have a large pitch and work with very high loads.

Features:

- Completely closed structure, easy to clean and to disinfect.
- Excellent wear and chemical resistance.
- Recyclable.

VERSION STANDARD (LFG MATERIAL)

Strength and weight data for other materials available on request.

Backflex radius: 60 mm (2.36 in)

Max load capacity: 115 kN/m (7800 lbs)

Weight: 29,5 kg/m² (6.02 lbs/ft².)

Standard length:

width ≤ 800 mm (31.5 in): 16 pitches (1,016 m)

width > 800 mm (31.5 in): 12 pitches (0,762 m)

Pin material: PBT (white).

Steel pins optionally available.

Information about this product is only available on our Smart Guide® website.

DRIVE SPROCKETS

FOR BELT 2630

www.SystemPlastSmartGuide.com

The sprockets for 2630 series have a polygonal shape to provide optimum belt support. This is important for belts that have a large pitch and work with very high loads.

Features:

- Completely closed structure, easy to clean and to disinfect.
- Excellent wear and chemical resistance.
- Recyclable.

On request we can also provide machined sprockets with a different number of teeth or a different bore size.

25,4 mm (1") CHAINBELT FOR MAGNETIC CURVES

Applications:
The chainbelt magnetic system with closed top plates is best suited for conveying glass and pet containers (for example PET bottles with petaloid base).

NG® EVO conveyor components made from engineered plastic resin
Longer wearlife than acetal
Lower friction than acetal
Good chemical resistance
High abrasion resistance
It meets the requirement for materials as stated by EC1935/2004 and FDA CFR21 norms for direct food contact
Less dust than with acetal chains
More.....

New

Reduce noise level by 12 dB

New
NG evo

NG evo conveyor components made from engineered plastic resin

- Longer wearlife than acetal
- Lower friction than acetal
- Good chemical resistance
- High abrasion resistance
- It meets the requirement for materials as stated by EC1935/2004 and FDA CFR21 norms for direct food contact
- Less dust than with acetal chains
- More.....

Features:

This system offers a unique solution for sideflexing applications in plants with modular conveyors.

Applications:

- To be used in the dry end of the line where bottles or cans run in lanes separated by guides.
- The short pitch makes in-line transfers possible.

Weight: 13,7 kg/m² (2.8 lbs/ft².)

Pin material: Ferritic Stainless Steel

This belt is bi-directional and can make both left and right turns. Even S-curves are possible if the load allows for that. The belt is available with several clips and guiding systems.

* Single track

Clips without TAB "C" Version

Just a clip for pin retention.

Clips with slider shoe "S" version

Attached to the pin retention clip is a slider shoe that can reduce friction and act as a wear part.

* Single track

25,4 mm (1") MODULAR BELTS 2256 - RUBBER INSERT

www.SystemPlastSmartGuide.com

SIDEFLEXING

NG® evo conveyor components made from engineered plastic resin
 Longer wearlife than acetal
 Lower friction than acetal
 Good chemical resistance
 High abrasion resistance
 It meets the requirement for materials as stated by EC1935/2004 and FDA CFR21 norms for direct food contact
 Less dust than with acetal chains
 More.....

30740a

This belt is bi-directional and can make both left and right turns. Even S-curves are possible if the load allows for that. The belt is available with several clips and guiding systems.

Without TAB "C" version

Just a clip for pin retention.

With slider shoe "S" version

Attached to the pin retention clip is a slider shoe that can reduce friction and act as a wear part.

With TAB "T" version

Attached to the pin retention clip is a TAB that holds the belt down in the curves.

With TAB & Positioner "TP" version

Attached to the pin retention clip is a TAB-Positioner combination that holds the belt down in the curves but also guides the belt on straight sections.

SIDEFLEXING

Features for 2351:

- Radius – width ratio min. 1,6
- Can also be used in S-curves

Weight: 9.0 kg/m² (1.84 lbs/f².)

Type 2351 - Curve ratio 1,6

Features for 2551:

- Radius – width ratio min. 1,0 for tight curves

Weight: 8.2 kg/m² (1.67 lbs/f².)

Features for both:

- Optimum product support
- Strong design
- For left or right L- or U-turns
- Easy installation and maintenance

Pin Material: PBT white

Standard length:

- width ≤ 850 mm (33.46 in): 1,524 m (5 ft.)
- width > 850 mm (33.46 in): on request

Type 2551 - Curve ratio 1,0

SPROCKETS WITH BUSHINGS CONCEPT / DETAILS

www.SystemPlastSmartGuide.com

- No rotation of nuts inside plastic.
- Fail safe disassembling.
- Quick and easy replacement.

- Reduced number of holes providing.
 - Better hygiene
 - Easier access
 - Less tooth perforation.
- Completely closed structure, easy to clean and to disinfect.

MOLDED SPROCKETS 2120-2250 SNAP CONCEPT / DETAILS

www.SystemPlastSmartGuide.com

New

The molded sprockets for our 2120-2250 series plastic modular belts have been improved. In comparison to the previous sprocket design. The new sprockets offer following benefits:

LONGER LIFE

The sprocket teeth have been enlarged by 8% (2250 only) to better transfer the load from sprocket to belt. This will also result in a longer wear life of sprocket and belt. Moreover, a new material is used, which is more stable in all application conditions and offers increased impact resistance.

EASIER USE OF SHAFT COLLARS

Shaft collars can now be used more easily. Hub width has been slightly reduced from 49 mm to 47,5 mm. Now, all our standard shaft collars can be used in combination with these sprockets, even on conveyors with 85 mm center-to-center distance.

SIMPLER INSTALLATION

Bolts and nuts can be inserted in the proper seats with a small interference, designed to avoid losing these parts during assembly/disassembly. There will be no more time lost due to bolts or nuts falling to the floor while installing a sprocket. The new and unique snap-fastening system is another feature that makes sprocket assembly much easier. The T-shaped lip at the edge of the sprocket half, simply snaps into its counterpart in the other half. When put around the shaft, the two halves will stick together even without fixing the bolts and nuts.

IMPROVED STRENGTH AND WEAR LIFE

The design of the rib structure, especially around the hub, has been optimized. This has resulted in improved strength and reduced weight at the same time. The improved roundness results in a smoother belt operation.

NEW SNAP-FASTENING SYSTEM

The new and unique snap-fastening system makes sprocket assembly faster and easier. Besides, the strength has been improved by adding a T-shaped rib and a new design of the hub area.

Parts snap together without fixing bolts

T-snap lip

For drive and return sprockets, go to:

2120 series, go to:

3 0 1 6 0 a
3 0 1 6 0 c

2250 series, go to:

3 0 3 9 5 a
3 0 3 9 5 c

Note:

The new sprockets are completely interchangeable with the previous design. Part numbers and item descriptions are unchanged.

INTRODUCTION TO CURVES

www.SystemPlastSmartGuide.com

INDEX CURVES GO TO:

5 0 0 1 0 a Index magnetic curves

5 0 0 1 0 b Index curve and straight track for TAB

REGAL OFFERS A COMPLETE RANGE OF CURVES AND STRAIGHT TRACKS, DESIGNED FOR ALL POSSIBLE CONVEYOR APPLICATIONS. BELOW A BRIEF OVERVIEW OF THE VARIOUS CHARACTERISTICS.

BEVEL:

Magnetic system with metal strip: "EXTRA" curves

Regal has developed a magnetic curve retention system for dry-running applications. The system, sets new performance standards in magnet curve technology due to the inclusion of a unique metal strip mounted in the inside bearing face of the top section. This area is constantly under load due to the pressure/speed factor.

Main advantages:

- Extreme dissipation of heat significantly reduces wear.
- Under test conditions, lowest noise decibel levels were recorded.
- "Extra" curves are strongly recommended with plastic chains only!

TAB:

TOPTRAC®

TOPTRAC® magnetic curve

System Plast® TopTrac® system is a new concept for magnetic curves, developed by Regal. The Nolu-SR™ interchangeable wear strips allow for higher speeds and loads. New magnet design and material results in a homogenous magnetic field, which improves product stability and productivity. The Nolu-SR wear strips can be quickly replaced, while curve remains fitted in the system.

Go to: 5 0 0 0 6 a

MAGNETIC:

COMPARISON OF CURVE SYSTEMS:

	BEVEL	TAB	MAGNETIC
Secure chain retention:	+	+++	++
Support in return part:	-	++	+
Chain can be lifted for cleaning:	++	-	+++
Jamming due to foreign particles:	+	-	++

Design and functionality:

Dual Magnetic System curves have the magnets positioned on the outside of the centre line radius of each track which results in a more effective magnetic field through the curve.

SPECIAL CURVES FOR DRY RUNNING APPLICATIONS

Nolu-S™(R) material are a unique compound of UHMWPE and a solid lubricant. They drastically reduce the coefficient of friction, maintaining the characteristics of UHMWPE. Nolu-SR material have a better thermal conductivity compared with UHMWPE.

Benefits and features of Nolu-S(R) material:

- They makes very high speeds possible, especially when running dry.
- They has an extremely low coefficient of friction.
- They reduces noise and squeaking.
- They reduces chain pull.
- They extends the life of the chain.
- They does not damage and scratch the surface of PET.
- They reduces the consumption of energy.
- They is a UHMWPE with a solid lubricant.

TCO COMPARISON TRADITIONAL AND TOPTRAC® CURVE

Improves Total Cost of Ownership

- Use high grade material only where required. The base plate is made of basic material. The strips are Nolu-SR.
- When, after some years of use, the curve is due for replacement, only the strips need replacing. Cost of strips is much lower than the cost of an entire curve upperpart.
- Reduces the need of high value spare parts. Just a few strips are enough to be well prepared for maintenance jobs.

Clip-on profiles

- Replaceable Nolu-SR profiles.
- Reduced maintenance and installation time and costs.
- Independent maintenance for each track.
- Replacing the strips can be done with the curve still mounted in the conveyor. This drastically reduces the required time for replacement. Maintenance becomes quicker and easier.

For profiles, go to:

5 0 5 6 5 a

Optimized magnetic field

- Smoother chain operation and reduced risk of stick-slip effect.
- Optimized and homogeneous magnetic field.
- Improved engineered design.
- Better product stability.

INDEX WEAR STRIPS

www.SystemPlastSmartGuide.com

STANDARD MATERIAL: UHMWPE

This ultra high molecular weight material is the choice for a wide variety of applications. The low friction characteristics of UHMW allow chains and containers to move at high speed with minimum drag and noise as well as minimum container damage.

BENEFITS:

- Low friction
- High wear resistance
- High temperature resistance

NOLU®-S COMPONENTS

Nolu-S components are made a blend of UHMWPE and other dry lubricants that maintain good wear characteristics while significantly reducing coefficients of friction. Their unique self lubricating properties make them ideal for applications requiring reduced friction, noise reduction and higher dry-running speeds.

BENEFITS:

- Extends the life of mating surfaces
- Lowers mating surface scratching or damage
- Reduces energy consumption
- Minimizes product pulsation on conveyors
- Low noise operation

CONVEYOR WEAR BED

www.SystemPlastSmartGuide.com

Valu Guide® rail can be used to form a wear bed grid for metal or plastic belts.

NOTE: For even distribution of load over width of belt, use the same type of guide through out your application.

MATERIAL:

- Metal profile in stainless steel AISI 304, AISI 430 or anodized Aluminum.
- Wear strip in UHMWPE or Nolu-S™ wear strips.

CHARACTERISTICS:

- Very low friction coefficient.
- High resistance to chemical agents.
- No liquid absorption.

SUPPLY:

- 3 or 6 meters.

APPLICATION:

- Chain and belt guide.

Information about this product is only available on our Smart Guide® website.

CLAMPS FOR CONICAL SIDE GUIDES

DOUBLE PLASTIC CLAMPS WITH ROD OTHER CENTER DISTANCES

This clamp is also suitable for conical guides.

MOQ Min. order quantity: 300 pcs.

Material: reinforced polyamide (PA-FG Black), screw, washer and rod in stainless steel.
Application: the clamp is designed to be used with either the conical or Ø 12 mm round guide rails, simply by turning the internal flange plate.
Use: to support rods or conical guide rails with increased centers.
Supply: assembled.

PRODUCT GUIDES AND CLAMPS FOR FLAT SIDE GUIDES

www.SystemPlastSmartGuide.com

GUIDE RAILS (FLAT TYPE)

Material: Polyethylene PE 500 (green).

Characteristics:

- Profile can be bent or calendered by means of usual systems.
- Coefficient of linear expansion: 2.5×10^{-4} .
- Temperature range for continuous use in air: -35°C / +70°C.
- Min. bending radius: 200 mm.

Notes: when sealing the ends, a 2 mm space must be left between the silicone and the end of the bar to compensate for linear contraction of the guide rail at low temperatures.

Characteristics: To use this guide, a 30x5 mm steelbar should be inserted.

Helps guide PET and HDPE containers in high speed, air conveying applications. Nolu-SR™ is made with a proprietary alloy of reinforced UHMWPE and other USDA accepted lubricants, resulting in a harder, lower friction material that is ideal in these applications. Though designs differ, the choice should be Nolu-SR, proven to increase throughput, reduce jams and wear longer.

Material: Nolu-SR is made with a special UHMWPE with modified molecular structure that helps guide PET containers in high speed applications.

Nolu-SX™ have the same characteristics as Nolu-SR, but with reduced thermal expansion (up to 40%)

GUIDES FOR PET BOTTLES

Aluminum guide rail with Nolu-S™ insert is used to guide containers, especially PET and HDPE, in application such as air conveying. Many air conveyor users and manufacturers have found that brush guides tend to get contaminated with debris, which causes increased friction and marking of PET bottles. Nolu-S have the perfect combination of extremely low friction in a tough UHMWPE based material.

NOLU-S will not mark bottles while allowing faster speeds and greater throughput.

For clamps, go to:

	-	-	-	30 m	30 m	0.10

NOLU-S™
NOLU-SR™ neck guides and **NOLU-S** body guides, with an ultra low coefficient of friction, reduces the degree of bottle tilt and the corresponding wear problems.

OTHER GUIDES
Other guides (especially brushes), when contaminated, can cause irregular tilt and orientation of the bottles, resulting in blockage at curves or inclines.

ROLLER SIDE GUIDES FOR STRAIGHT APPLICATIONS

www.SystemPlastSmartGuide.com

Material:

Straps in reinforced polyamide, rollers in acetal resin, screws in stainless steel. Pins and metal profile see the table.

Standard packaging: 2 completely assembled guides.

Applications: designed for rugged boxes and containers.

Note: each segment can be pulled out without removing pins and rollers.

Features:

- Low noise rollers.
- Excellent for accumulation areas.
- Long life and smooth operation.
- Easy and quick installation.

ROLLER GUIDES - FLEXIBLE MODULES

FLEXIBLE INTERMEDIARY ROLLER MODULES 19,5 mm

www.SystemPlastSmartGuide.com

FLEXIBLE MODULES

Material: straps and spacers: reinforced polyamide; rollers and pins: in acetal resin, threaded bush in nickel plated brass, screws in stainless steel.

Application: designed for boxes and containers (glass and plastic bottles, tin cans, strong aluminium cans).

Features:

- Improve design
- Smaller rollers and pitch
- Improved performance
- Reduced dimensions
- Low noise rollers
- Excellent for accumulation areas
- Long life and smooth operation
- Easy and quick installation on flat metal profile 40X8

FLEXIBLE SPEEDRAIL™

Material: profile: PVC, rollers: in acetal resin, screws: stainless steel.

Operating temperature range: -10°F to + 180°F

Features:

- Bend by hand to create corners or S-curves easily.
- Can be twisted to help invert containers.
- Saves time and labor associated with machine bending.
- Compatible with other Valu Guide components.
- Available with beads or roller.

These roller guides can be curved.
Min. radius in either direction: 460 mm

EXTRA LONG CROSS OR PARALLEL BLOCKS

Features: cross blocks, in a variety of bore configurations, including square bore combinations.

Material: reinforced polyamide with stainless steel bolts. Internal connecting joint and pins in nickel plated brass.

Supply: assembled.

Use: it connects two round or square rods at 90°.

These clamps can also be assembled for 2 parallel rods.

SIDE MOUNTING TOP BRACKETS

www.SystemPlastSmartGuide.com

Material: reinforced polyamide. Screw, nut and washers in stainless steel AISI 304

Note: the bracket can be inclined by 5° in both directions when using the lower hole and the upper slot hole.

There are two optional holes that can easily be opened by removing the thin membrane.

In this way the centre distance of the holes can be:

- Enlarged to 70 mm or
- Reduced to 30 mm

Then it is also possible to use an incline of 10° in both directions

PANEL MOUNTING PROFILES

www.SystemPlastSmartGuide.com

Material: rigid - flexible PVC.

Application: this profile can be used with plain Tubes 25x25 mm in different materials. If used for the mounting of panels and windows it offers the possibility to remove the panels without disassembling the complete structure, thanks to the special profile in PVC, partially rigid and partially flexible.

FLANGED HOUSINGS - 2 HOLE VERSIONS

GRUB SCREW VERSION - FOR SHAFT DIAMETERS: 20-40mm

For shaft lock with eccentric ring, go to: **56040a**

Also available for 12-17 mm shaft diameters. Go to: **56030a**

For new Sealmaster® Skwezloc® bearings, go to: **56042a**

For new Sealmaster® Skwezloc® PN GOLD™ bearings, go to: **56044a**

TECHNICAL INFORMATION

- Types UFL and UCFH have solid polyamide housings for ultimate strength, no trap for contamination (UCFL types have a ribbed back).
- Good resistance against many corrosive chemicals such as water, oils, greases, petrol, milk, wine, alcoholic beverages.
- Available in chrome steel and stainless steel (suitable for food, beverage and pharmaceutical industry).
- Housings also available as complete sealed units for improved protection (wash down resistant version).
- Max. mis-alignment between shaft and housing: 2.5°

SEALMASTER

FEATURES AND BENEFITS

- High Phosphorous Nickel Plated Bearing Inner & Outer Ring for exceptional corrosion resistance.
- High Performance Triple Lip Seal to minimize contamination ingress and retain lubrication.
- Locking collar centers the shaft in the bearing bore and secures the shaft with near perfect concentricity.
- Reduced Bolt Hole Spacing to replace OEM compact conveyor designs with 30mm and 40mm shaft diameters.
- Durable polyamide housing with corrosion resistant bolt hole spacers.
- Securely fastened snap in end cap to further protect bearing with drain hole to prevent liquid build up inside.
- Lubed for Life design with Tapered Land Outer ring race profile to direct lubrication into the ball path.
- Max. mis-alignment between shaft and housing: 2°

COMPONENTS

Housing in reinforced polyamide light grey. High precision self-aligning ball bearings in hardened corrosion resistant steel. Spacers in nickel plated brass. Safety cap in polypropylene (transparent-yellow).

SEALMASTER

FEATURES AND BENEFITS

Sealmaster PN GOLD™ mounted bearings feature high phosphorus, electroless nickel coated steel insert with patented seal technology available in either setscrew or SKWEZLOC® concentric locking collar, 316 stainless casting and high strength housing configurations. The high performance triple lip seal is the latest innovation of over 10 patents on sealing technology. The combination of stainless flingers and FKM lip materials provide a strong contaminant resistance and GoldPlex® FG (USDA H1) food grade grease loss. Specially engineered for industries with corrosive wash down environments such as food and beverage, pharmaceuticals and chemical processing. PN GOLD mounted ball bearings provide outstanding performance in demanding corrosive environments.

COMPONENTS

- Bearing Housing Material: 316 Passivated stainless steel
- Bearing Insert Material: High phosphorus electroless nickel coated steel
- Seal Material: High performance triple lip seal
- Self Alignment: +/- 2°
- Lock Type: Skwezloc concentric locking collar
- Temperature: -29° to 104° C (-20° to 220° F)
- Grease: Sealmaster GoldPlex-FG
- End cap in stainless steel (bolts included) - must be ordered separately

FLANGED BEARING UCFO / UCFO-R / UCFO-RL

www.SystemPlastSmartGuide.com

FOR SHAFT DIAMETERS: 12-17mm

Also available for 20-40 mm shaft diameters. Go to:

56050a

TECHNICAL INFORMATION

- Type UCFO has a solid polyamide housing for ultimate strength; no trap for contamination.
- Good resistance against many corrosive chemicals such as water, oils, greases, petrol, milk, wine, alcoholic beverages.
- Housings also available as complete sealed units for improved protection (wash down resistant version).
- Max. mis-alignment between shaft and housing: 2.5°

A	B	C	J	WEIGHT KG(IND.)

VERSION WITH GRUB SCREWS

COMPONENTS

Housing in reinforced polyamide. Seals in NBR rubber. High precision self-aligning ball bearings in chrome or stainless steel, pre-lubricated. Grease nipples and spacers from nickel plated brass. Washers (where used) in AISI 304 (DIN 1.4301). Safety cap in polypropylene. (When fitted with a stainless steel bearing, the grease nipple is in stainless steel).

Shaft lock with eccentric ring

Type A:
Flat bearing with grease nipple (angle 25°) and ribs.

Type B:
Flat bearing with grease nipple (horizontal 0°).

TECHNICAL INFORMATION

- Type UCFQ has a solid polyamide housing for ultimate strength; no trap for contamination. (UCF type has a ribbed back).
- Good resistance against many corrosive chemicals such as water, oils, greases, petrol, milk, wine, alcoholic beverages.
- Available in chrome steel and stainless steel (suitable for food, beverage and pharmaceutical industry).
- Housings also available as complete sealed units for improved protection (wash down resistant version).
- Max. mis-alignment between shaft and housing: 2.5°

SEALMASTER®

FEATURES AND BENEFITS

- High Phosphorous Nickel Plated Bearing Inner & Outer Ring for exceptional corrosion resistance.
- High Performance Triple Lip Seal to minimize contamination ingress and retain lubrication.
- Locking collar centers the shaft in the bearing bore and secures the shaft with near perfect concentricity.
- Reduced Bolt Hole Spacing to replace OEM compact conveyor designs with 30mm and 40mm shaft diameters.
- Durable polyamide housing with corrosion resistant bolt hole spacers.
- Securely fastened snap in end cap to further protect bearing with drain hole to prevent liquid build up inside.
- Lubed for Life design with Tapered Land Outer ring race profile to direct lubrication into the ball path.
- Max. mis-alignment between shaft and housing: 2°

COMPONENTS

Housing in reinforced polyamide light grey. High precision self-aligning ball bearings in hardened corrosion resistant steel. Spacers in nickel plated brass. Safety cap in polypropylene (transparent-yellow).

SEALMASTER®

FEATURES AND BENEFITS

Sealmaster PN GOLD™ mounted bearings feature high phosphorus, electroless nickel coated steel insert with patented seal technology available in either setscrew or SKWEZLOC® concentric locking collar, 316 stainless casting and high strength housing configurations. The high performance triple lip seal is the latest innovation of over 10 patents on sealing technology. The combination of stainless flingers and FKM lip materials provide a strong contaminant resistance and GoldPlex® FG (USDA H1) food grade grease loss. Specially engineered for industries with corrosive wash down environments such as food and beverage, pharmaceuticals and chemical processing. PN GOLD mounted ball bearings provide outstanding performance in demanding corrosive environments.

COMPONENTS

- Bearing Housing Material: 316 Passivated stainless steel
- Bearing Insert Material: High phosphorus electroless nickel coated steel
- Seal Material: High performance triple lip seal
- Self Alignment: +/- 2°
- Lock Type: Skwezloc concentric locking collar
- Temperature: -29° to 104° C (-20° to 220° F)
- Grease: Sealmaster GoldPlex-FG
- End cap in stainless steel (bolts included) - must be ordered separately

COMPONENTS

Housing in reinforced polyamide. Seals in NBR rubber. High precision self-aligning ball bearings in chrome- or stainless steel, pre-lubricated. Grease nipples and spacers from nickel plated brass. Washers (where used) in AISI 304 (DIN 1.4301). Safety cap in polypropylene. (When fitted with a stainless steel bearing, the grease nipple is in stainless steel).

VERSION WITH GRUB SCREWS

TECHNICAL INFORMATION

- Good resistance against many corrosive chemicals such as water, oils, greases, petrol, milk, wine, alcoholic beverages.
- Available in chrome steel, and stainless steel bearings, (suitable for food, beverage and pharmaceutical industry).
- Housings also available as complete sealed units for improved protection (wash down resistant version).
- Max. mis-alignment between shaft and housing: 2.5°

MATERIAL

- Rings and balls in chrome steel.
- Grub screws and protection rings are in steel.
- Seals in metal with vulcanised NBR rubber.

MODSORT

Features and benefits:

- Can be easily integrated into existing traditional or motorized roller conveyor systems.
- Ability to transfer a wide array of products.
- Mechanical lift unneeded (only two means of motion required).
- Run smaller packages without "gaps" associated with pop-up transfer modules.
- Ideal for handling polybags and smaller packages.
- Utilizes unique System Plast® 2253 roller top belt technology.
- Zero contact, zero pressure accumulation.
- Run on demand technology.
- Low noise and low voltage (24VDC, no conduit required).
- Energy savings as high as 50%-60% as compared to traditional conveyors.
- Easy maintenance through minimum spare parts requirements.
- High resolution package control.

MODFLEX™ MODULAR CURVE

www.SystemPlastSmartGuide.com

MODFLEX™

MODFLEX - R800 L1400 A90 R - TM

PRODUCT TYPICALLY CONVEYED

General information:

- Compact design in relation to the width of the belt (small radius in combination with wide curve possible).
- Position and orientation of conveyed products perfectly controlled and not altered during operation.
- Relatively small in-feed and out-feed rolling diameters to grant a good product transfer.
- High strength and resistance to heavy loads.
- High linear speed.
- Easy maintenance requirements.

Features:

- Suitable for conveying large and heavy products.
- Safe design (completely closed structure).
- High wear resistance.
- High chemical resistance.
- Low noise.
- Dry run solution.

Application:

- Logistics industry and distribution centers.
- Food and beverage.
- Tiles, bricks and cement production.
- Woodworking industry.
- Hostile environments and heavy duty operation in general.

Details:

- Max load allowed: 250 Kg/m (2450 N/m).
- Max speed on inner radius Ri: 60 m/min.
- Curve angle 90° and 180°.
- Useful width (W) from 200 mm to 1600 mm.
- Inner radius (Ri) from 500 mm to 2000 mm.
- Frame height (H) 235/275 mm.
- Frame in stainless steel.
- Low friction plastic belt material - color blue.
- Gearbox not included (40mm shaft diameter).
- Feet and legs not included; brackets, connecting joints, support bases and levelling pads can be provided on demand.

PATENT PROTECTED

Features for iCOF device:

- Real time monitoring of the line condition.
- Addressing all container type (PET, glass and cans).
- Continuously measures the coefficient of friction.
- Calculates average value and a trend.
- Triggers an alarm if pre-set limits are reached.
- Can be portable or integrated in line control system.

Benefits:

- No operator intervention required for measuring.
- Easy to define optimum cleaning regime: "Smart Cleaning".
- Corrective action can be scheduled before efficiency is affected.
- Long term line condition can be analyzed using data from the iCOF device.

Why Coefficient of Friction?

Variations in the coefficient of friction are a good indicator of changing conditions or pollution of the conveyor. Especially in dry running lines, the friction is a key factor for the proper handling and flow of containers. A permanent control process will help maintaining the optimum conditions and thus guarantee the line efficiency.

How does it work?

The iCOF device can be mounted on a conveyor and integrated in the line control system. It measures the friction at regular intervals that can be set by the user. Obtained data is used to calculate the average value as well as the trend. The values can trigger a signal once a pre-set limit is passed. Based on this signal, the user can check the situation and decide about the required corrective action. The system can work with Ethernet or Profinet protocol. Output is done through RJ45 connector. Obviously for integration in the line control system, a close cooperation with the OEM is required. The iCOF device can also be used as a stand-alone or portable device for spot measurements.

Where can it be used?

The iCOF device can be used throughout the line wherever it makes sense to temporarily or continuously monitor the friction to collect performance data, obtain data for trouble shooting or to act as continuous input for the line controls.

APPLICATION TYPE	COMPLETE UNIT - SLIDER INCLUDED*	
	ITEM DESCRIPTION	
PET 		ICOF-PET
CAN 		ICOF-CAN
GLASS 		ICOF-GLASS

SPARE PARTS - SLIDERS ONLY	
ITEM DESCRIPTION	
	ICOF-SLIDER-PET
	ICOF-SLIDER-CAN
	ICOF-SLIDER-GLASS

Box includes:

- iCOF® device
- Slider (PET, CAN or GLASS)
- Set of screws for slider
- Screw driver
- USB drive with GUI

* The complete unit includes already related slider.

iCOF® CONDITION MONITORING

www.SystemPlastSmartGuide.com

ACCESSORIES

CONTROLLER

ITEM DESCRIPTION

ICOF-CONTROLLER MODULE

STAND ALONE: Secondary mode, for portable use and quick installation

a) CONTROLLER MODE

7 Inches touch screen, 24V industrial tablet, waterproof
 Software and GUI embedded into the controller
 Easy and quick connection to the iCOF device
 (pre set plugs and cables)
 Plug and play
 Easy fixing to the conveyor frame

USB HARDWARE PEN

ITEM DESCRIPTION

USB HARDWARE PEN

STAND ALONE: Secondary mode, for portable use and quick installation

b) PC MODE

Alternative mode (not recommended - PC often not allowed in line)
 It requires software for data acquisition (available)
 It requires PLC emulator (hardware key supplied apart)
 24V adaptor to line current for iCOF condition monitoring device supplied as optional on request.

IMPORTANT NOTE

This mode of use implies PC rights at Admin level. Being the architecture of the software is based on the PLC architecture, it may become necessary to bypass the firewall by opening some backdoors. This often is a not acceptable condition for a PC security.

POWER SUPPLY

ITEM DESCRIPTION

ICOF-KIT POWER SUPPLY

100-240V 24V-1.25A 50-60Hz

PORTABLE SUPPORT STRUCTURE

ITEM DESCRIPTION

ICOF SUPPORT B520x1100xH1800mm

Mainly meant for stand alone use, for quick measures or when different measuring points are required

Easy assembly

Made of aluminum tubes (abt 20kg weight)

Overall dimensions: 1100 x 520 x 1800 mm

Work layer: adjustable from 979 to 1226 mm

7 2 0 1 2 a SELECTION GUIDELINES – STAINLESS STEEL CHAINS

◀ back continue ▶

	A - PRESSURELESS COMBINER/DECOMBINER, HIGH SPEED
RECOMMENDED CHAIN SERIES Best choice for high demanding application: high speed, instable product	1 1 0 2 0 a Straight • SPSL815 series with HB pin version 1 1 0 6 0 a Sideflexing • SPSL881 series with HB pin version
OPTIONAL CHAIN SERIES For less demanding applications	1 1 0 3 0 a Straight • SSE815 with HB pin version 1 1 0 6 0 a Sideflexing • SSE881MO with HB pin version
GENERAL RECOMMENDATIONS	<ul style="list-style-type: none"> Lubrication is recommended for all sections with SS chains. K330 width offers reduced gap between adjacent chains and improve product handling.

	B - MASS CONVEYOR
RECOMMENDED CHAIN SERIES	1 1 0 3 0 a Straight • SSL815/SSEL815/SSE815/SS812 with HB pin version 1 1 0 6 0 a Sideflexing • SS/SSL/SSE 881 series with HB pin version
OPTIONAL CHAIN SERIES	1 1 0 3 0 b Straight • S815 series
GENERAL RECOMMENDATIONS	<ul style="list-style-type: none"> Lubrication is recommended for all sections with SS chains. No lube with S815 series. K330 width offers reduced gap between adjacent chains and improve product handling.

Regardless the conveyor type, its working condition has an impact on the chain's service life. Please follow the below recommendation for these particular working condition.

1. Abrasive working conditions: use chain series with HB pin version and keep the conveyor as clean as possible (frequent cleaning regime);
2. Corrosive working conditions: use chain made of Austenitic Stainless Steel (SSA material);

In case you need support for such application please contact our technical support team at technicalsupport@systemplast.com

**STAINLESS STEEL CHAINS
CONVEYOR LENGTH AND SPEED**

MAXIMUM CONVEYOR LENGTH DEPENDS ON

- Chain/belt type
- Wearstrips material
- Return system
- Configuration (curves, inclines, etc.)
- Lubrication
- Product material
- Load on conveyor / accumulation
- Speed
- Environmental factors (such as temperature, contamination, humidity etc.).

TYPE	MAX. RECOMMENDED LENGTH [m]	MAX. RECOMMENDED LENGTH [ft]
Stainless steel, straight	Approx. 15	Approx. 50
Stainless steel, sideflexing	Approx. 9 - 12	Approx. 30 - 40

These are general guidelines to optimize chain performance and reduce product handling issues.

It is recommended to double check the conveyor length by calculating the resulting chain pull.

Our System Plast Engineering Calculator, SPEC® software, is available at <http://spec.systemplast.com> to provide support with these calculations.

A phenomenon called the **slip stick effect** occurs unpredictably. It occurs in long conveyors as the friction and drag stretches the chain/belt. Once enough belt/chain pull accumulates the tension will cause the belt/chain to spring forward. It depends on speed/length ratio, load, construction and lubrication. Pulsating dynamic forces are the result and affect the service life of all components of a conveyor. More importantly it influences product handling in a negative way especially with unstable products.

If unsure of the best solution for your application, consult our technical support.

MAXIMUM SPEED

TYPE	LUBRICATION		LUBRICATION	
	DRY	WATER AND SOAP	DRY	WATER AND SOAP
Straight stainless-steel chain series 815, 812, 814, 800, 802, 805, 8157 and 515	Not recommended	130 m/min	Not recommended	430 ft/min
Sideflexing stainless steel chain series 881, 881 TAB, 881M and 8857	Not recommended	130 m/min	Not recommended	430 ft/min
Sideflexing plate top chain series 1874, 1874 GV	100 m/min with lube on roller chain		330 ft/min with lube on roller chain	

Maximum speed is of course depending on further application details.

Under abrasive or high load conditions the maximum speed is reduced.

High speed in combination with short conveyor yields a high speed to length ratio, causing high wear rate and chain/belt elongation (i.e service life reduction).

For more wear-resistant materials see the materials section at page **7 3 5 6 0 a** or contact our technical support.

It is important to check if the combination of load and speed, also known as pressure and velocity or the "PV-value", is acceptable for the selected applications in curves.

Our System Plast Engineering Calculator, SPEC® software, is available at <http://spec.systemplast.com> to provide support with these calculations.

For more detailed support above 80 m/min (260 ft/min) please contact our technical support.

PLASTIC CHAINS AND BELTS

CONVEYOR LENGTH AND SPEED

MAXIMUM CONVEYOR LENGTH DEPENDS ON

- Chain/belt type
- Wearstrips material
- Return system
- Configuration (curves, inclines, etc.)
- Lubrication
- Product material
- Load on conveyor / accumulation
- Speed
- Environmental factors (such as temperature, contamination, humidity etc.).

TYPE	MAX. RECOMMENDED LENGTH [m]	MAX. RECOMMENDED LENGTH [ft]
Plastic chains/belts, straight (*)	Approx. 12	Approx. 40
Plastic chains/belts, sideflexing	Approx. 9 - 12	Approx. 30 - 40
Plate top	Approx. 15	Approx. 50

These are general guidelines to optimize chain performance and reduce product handling issues.

It is recommended to double check the conveyor length by calculating the resulting chain pull.

Our System Plast Engineering Calculator, SPEC® software, is available at <http://spec.systemplast.com> to provide support with these calculations.

A phenomenon called the **slip stick effect** occurs unpredictably. It occurs in long conveyors as the friction and drag stretches the chain/belt. Once enough belt/chain pull accumulates the tension will cause the belt/chain to spring forward. It depends on speed/length ratio, load, construction and lubrication. Pulsating dynamic forces are the result and affect the service life of all components of a conveyor. More importantly it influences product handling in a negative way especially with unstable products.

If unsure of the best solution for your application, consult our technical support.

(*) Conveyor with micropitch belt 2080FT should have a maximum length of 2 m for an acceptable service life.

MAXIMUM RECOMMENDED SPEED

TYPE	LUBRICATION		LUBRICATION

Etc		

The 2122FG series belt does not have pockets to position the sprockets. This makes positioning the sprockets very flexible. It is important that the teeth of the sprocket push against the spherical side of the hinge eye. Also, do not position a sprocket where two modules meet.

Note: Regal recommends the full complement of sprockets be used to maximize belt strength and wear life. Fewer sprockets can be an option for lightly-loaded or short conveyor applications. Consult our technical support for additional information.

7 2 1 3 2 a SPROCKET KEYWAY DIMENSIONS

Note: Plain bores require to be machined.

There are three classifications for sprockets bores.

A **fixed** fitting means that the sprockets are not able to move after installation. This applies to split sprockets.

A **tight** fitting means that the sprockets can be moved on the shaft, but not easy. This applies to one piece sprockets only.

A **floating** fitting means that the sprockets are able to move easy along the shaft and follow belt expansion and contraction. This applies to all square bores, all bores with double keyway and all idler bores.

To indicate a plus bore just add the letter -P to the standard item description for example 2250-12R25M-D **PMS**.

Also split sprockets are available with a plus tolerance to be able to move freely along the shaft.

SHAFTS

Stainless steel is recommended in every case.

Sufficient hardness (> 25 HRC) as well as smooth surface (<0.6 µm) is recommended.

For chains usually round shafts are used, for belts round or square shafts. Larger width belts often require square or double-keyed shafts to allow sprockets to adjust with the thermal elongation of belt width and to minimize the shaft torsion.

Shaft tolerance is usually H7 (DIN 6885)

Shafts and keys must be manufactured according to DIN 6885 or ANSI B17.1

General shaft locking: center sprocket is locked by set screw or collar shaft while other sprockets should be floating.

CURVE SYSTEMS FOR CHAINS

CURVE SYSTEMS

A sideflexing chain must be kept in a curve to avoid the chain lifting and pulling out from the curve. The chain is also guided on the return part by the curve system.

For general conveyor construction guideline refer to page **7 2 1 4 0 a**

THERE CAN BE DIFFERENT REQUIREMENTS WHEN CHOOSING A CURVE SYSTEM:

- Cost
- Cleanability
- Ease of maintenance
- Security
- Possible presence of foreign particles
- Abrasive conditions
- Inspector demands
- Side transfers

continue ►

For curves. Go to product page:

5 0 0 1 0 a

There are 3 different curve systems commonly in use:

TAB:

Curve has a tab design to physically keep the chain from lifting out of the curve. Carry ways and returns are the exact same profile - no additional support plate is needed.

For cleaning and inspection purpose, the chain can only be removed from the curve by disassembling the chain.

BEVEL:

Curve has a bevel design for matching the bevel chain. The angle of the curve inside helps the chain from lifting out of the curve track. Carry ways and returns are slightly different: a support plate is needed in the return to retain the chain.

For cleaning and inspection purpose, the chain can only be removed from the curve by disassembling the chain.

CURVE SYSTEMS

◀ back

For curves.
Go to product page:
5 0 0 1 0 a

TAB and bevel version.
Go to:
7 2 1 3 6 a

MAGNETIC:

Curve has magnets installed in the bottom of the carry curve track to hold the chain in place.

For cleaning and inspection purposes, the chain can be removed from the curve without disassembly enabling easier maintenance and inspection than TAB and bevel curves. Returns differ vastly from the carry ways as they retain the chain on the flights.

System Plast® magnetic curves have an optimized magnetic field which allows:

- Smoother chain operation and reduced risk of stick-slip effect.
- Homogenous magnetic field.
- Better product stability

COMPARISON OF CURVE SYSTEMS:

	BEVEL	TAB	MAGNETIC
Secure chain retention	+	+++	++
Support in return part	-	++	+
Chain can be easily lifted for cleaning	++	-	+++
Jamming due to foreign particles	+	-	++

Especially with unstable products and a multiple strand situation bevel and tab have a disadvantage: the link can rise in the curve creating a "step" between the individual strands:

With the magnet system the links remain flat on the curve:

CURVE SYSTEMS FOR BELTS

CURVE SYSTEMS

A sideflexing belt must be kept in a curve to avoid the belt lifting and jumping from the curve. The belt is guided also on the return part by the curve system.

For general conveyor construction guideline refer to page **7 2 1 4 0 a**

THERE CAN BE DIFFERENT REQUIREMENTS WHEN CHOOSING A CURVE SYSTEM:

- Cost
- Cleanability
- Ease of maintenance
- Security
- Possible presence of foreign particles
- Abrasive conditions
- Inspector demands - ease of inspection
- Side transfers

There are 3 different curve systems commonly in use for belt:

TAB:

Belts with TAB's require a curve with TAB track. TAB design can be different following the type of sideflexing belts. For further detail, refer to dedicated sideflexing belt sections.

For cleaning and inspection purpose, the belt can only be removed from the curve by disassembling the belt.

MACHINED GUIDE RAIL - C PROFILE:

Aluminum and UHMWPE guide rail are used for guiding and supporting modular sideflexing belts from the side.

For cleaning and inspection purpose, the belt can only be removed from the curve by disassembling the belt.

MAGNETIC:

The 2120M sideflexing belt uses magnets to hold it flat in the track. Returns differ vastly from the carry ways as they retain the chain on the flights.

Belt can be removed without disassembly enabling easier maintenance and inspections.

COMPARISON OF CORNER SYSTEMS:

	C-PROFILE	TAB	MAGNETIC
Secure chain retention	+++	+++	++
Support in return part	+	++	+
Chain can be easily lifted for cleaning	--	-	+++
Jamming due to foreign particles	+	--	++

LOAD ON CURVES

CURVE SYSTEMS

When designing a layout, the curves are often the limiting factor. A curve adds significantly to the chain pull because of the increased tension and friction between the chain/belt and the inner radius. The chain pull at the end of the curve (P_{OUT}) can be calculated by multiplying the curve factor times the chain pull at the beginning of the curve (P_{IN}). The curve factor "F" depends on the angle of the curve and the friction between chain and curve (for further calculations please refer to our SPEC® software calculation program <http://spec.systemplast.com>).

Because of this curve factor it's generally better to position a curve close to the idler end rather than close to the drive end. Then the load in the curve is reduced.

In general, it is recommend to keep the total curve angle in a conveyor below 180°. When running without lubrication, it is recommended to have no more than 90° with one drive.

The pressure on the inside of the curve increases through the curve. This plus the speed of the chain, generates heat. The maximum allowable pressure and velocity (speed) together is called PV limit. This is an important factor next to the maximum allowable chain pull. The generated heat will warm up the curve material and when it gets too warm, it will become softer and wears out quickly. Extreme cases can cause the chain or the curve material to melt and delaminate.

Use SPEC® calculator to check the load and PV limits for all applications:

To maximize the PV limit, Regal has developed some special curve materials.

DRIVE CONSTRUCTION
CONSTRUCTION RECOMMENDATIONS

Index return systems.
Go to product page:

5 1 0 1 0 a

END DRIVE

Usually used for uni-directional applications.
Preferred running direction of chain must be considered.

CENTER DRIVE

Usually used for bi-directional applications or when space at the end of the conveyor for a drive construction is limited.
Required configuration for dual nose over applications.
Commonly used for off-line accumulation tables.
Chains without preferred running direction are recommended.

WRAP AROUND ANGLE: α

Recommended angle on sprockets is 140° +/- 10°.
A too small angle may result in chain/belt jumping on the sprocket (too few teeth engaged in sprocket pockets).
A too large angle may result in chain/belt not releasing safely from the sprocket, leading to over-backflexing failures.

◀ back continue ▶

RECOMMENDED DIMENSIONS OF CATENARY SAG

The catenary sag helps to discharge the load and to release the chain/belt properly from the sprocket, while ensuring sufficient tension to keep the sprocket engaged with the chain/belt. The catenary sag also absorbs the chain/belt length variations due to the thermal expansion/contraction. It is also the location where elongation can manifest, allowing for more infrequent maintenance adjustments to remove links due to wear.

A properly set catenary sag is important for the correct operation of the chains/belts. Recommended catenary sag dimensions are in the below table for each chain/belt type. Dimensions should be measured during operation. General recommendation is to tighten the conveyor as tight as you can get it by hand to achieve the desired amount of catenary sag.

	A	B	C
	mm		
Chains	400-550	500-900	50-125
LBP chains	400-550	600-900	50-150
Belts	500-700	600-900	50-125
	in		
Chains	16 - 22	20 - 36	2 - 5
LBP chains	16 - 22	24 - 36	2 - 6
Belts	20 - 28	24 - 36	2 - 5

As a general rule of thumb for conveyors with roller returns, the catenary span (B) should be ± 1.5 times as long as the subsequent roller spans (A).

Speed, start-up frequency and drive control must be considered for the design of catenary sags.

Catenary sag should be checked and adjusted regularly due to chain elongation. If the catenary sag exceeds the recommended value (C), we suggest removing excess links.

Over-tightening the chain/belt (insufficient catenary sag) will lead to high hinge tension, which causes an increase of load on link load and fast wear rate on the hinge, even when the conveyor is not operating.

Excessive sag reduces the catenary tension (resulting in insufficient transferred force from the sprocket teeth) which could lead to improper disengaging of sprocket plus a deep sag which can run against structural parts.

In any case the length of the catenary sag (B) must be SIGNIFICANTLY longer than dimension A.

◀ back continue ▶

CATENARY SAG CALCULATION

The chain tension of catenary sag (F_c) can be calculated as follows:

$$F_c = \frac{L_c^2 * m_b * g}{8 * h_c}$$

$$\Delta L_c = 2.66 * \frac{L_c^2}{h_c} \text{ [m]}$$

$$\Delta hc = \sqrt{\frac{\Delta L_c * L_c}{2.66}} \text{ [m]}$$

F_c = Chain tension of catenary sag [N]

L_c = Length of the sag [m]

h_c = Height of the sag [m]

m_b = Weight of chain [kg/m]

g = Acceleration factor due to gravity (9.81 m/s²)

CATENARY SAG MAINTENANCE

New installation: catenary sag in position 1 with sag height of H1. After some time the sag will become longer and moves to position 2 with sag height H2.

When the sag reaches level 2 - ALARM LEVEL: some modules should be taken out (shorten the belt) to get the belt back to level 1. Otherwise the belt will start running against f.e. construction parts and a proper functioning is threatened. The position of level 2 is determined by the construction of the conveyor and the available space underneath the conveyor. Level 2 should be clearly marked on the conveyor and ideally limited by an alarm/safety switch since the sag is out of normal sight.

Typically, H1 is about 100 mm and H2 around 300 mm. But this is application specific and needs to be determined by the OEM and documented on site with the End User and on the conveyor itself. The end user is responsible for monitoring the sag height to avoid damages to the belt and the installation.

◀ back continue ▶

If no proper catenary sag construction is possible, e.g. in case of insufficient space, tensioners must be used.

The tensioner should be located at drive side close to the drive. If no room directly at the drive, it can be put a bit further in the return but the tensioner needs to compensate for that.

Index return systems.
Go to product page:
5 1 0 1 0 a

The tensioning force should be between (gravity take up): 50 - 100 N (11.24 - 22.48 lbs.) per belt meter width and 10 - 20 N (2.24 - 4.49 lbs.) per chain strand depending on the load and the layout.

Overtightening the chain/belt with the tensioner will lead to high hinge tension, which causes an increase of load on link load and fast wear rate on the hinge.

RETURN ROLLER FOR CHAINS/BELTS WITH HIGH FRICTION SURFACE:

The return section of the conveyor can be constructed using standard wearstrips or return rollers to support the chain on its return. Return rollers to be positioned at the side of the chain to avoid damage of the rubber top (see below picture). For wider chain or belt, central roller can be positioned in the middle where the rubber is thinner.

In case of rubber top belt, return roller to be positioned at the side or/and internal indent. Return roller width should be less than the side indent dimensions. Under no circumstances should a rubber-top belt be returned on a sliding bed which makes contact with the rubber surface.

WEARSTRIPS SERPENTINE SYSTEM

The serpentine systems increase the service life of chains/belts and provide increased chain/belt stability at higher speeds.

Serpentine systems permit high speed operation by eliminating the pulsation inherent to some return rollers.

Serpentine returns also spread the wear across the surface of the chain or belt, providing trouble-free service and increased service life. Return rollers can cause dishing, if they do not turn freely and the chain/belt slides across the surface. Dishing will make the contact surface inconsistent, causing product handling issues. In-line returns will cut grooves into the surface of the chain or belt, which will lead to product handling problems and premature chain failure.

1- CHAIN WITH SERPENTINE SYSTEM

Serpentine systems are used on the return part of conveyors chains

Serpentine returns are not recommended for rubber top or LBP chain/belt

2- BELT WITH SERPENTINE SYSTEM

Serpentine systems are used on the top and the return part of conveyors belts.

Serpentine carry support system is not recommended for belt with positioner.
Serpentine returns are not recommended for rubber top or LBP chain/belt.

3- SERPENTINE SYSTEM INSTALLATION

1. Install all Sticker/Snaplock™ clips (C) and appropriate spacers on the cross rods.
2. Install all cross rods (with attached Snaplock clips and appropriate spacers) except the ones positioning the return shoes
3. Thread the ValuFlex™ serpentine profiles (D) through the conveyor frame and fasten the profiles to the return shoes (A)
4. Mount shoes (A) on the appropriate cross rods and fasten the rods in place
5. Starting at the return shoe, move to the next cross rod and snap the serpentine profile into the clips. If intermediate Spacer/Pinchlock™ clip (B) are being used, install the first one row between the return shoe (s) and the first cross rod / Snaplock assembly.
6. Repeat this process, first installing the profile into the next cross rod / Snaplock clip assembly and then installing a Pinchlock clip between two new secured rod locations

SIDE TRANSFER

TRANSFERS

There are different ways of transferring products from one conveyor onto the next. This is depending on layout, available space, type of product, lubrication, self-clearing products etc.

continue ▶

SIDE TRANSFER (SEE BELOW):

①

②

Transfer with belts.
Go to:

7 2 1 6 6 a

THE MOST COMMON TRANSFER IS THE SIDE TRANSFER.

In this situation, the products are pushed sideward onto the next conveyor by the guide rail.

Consequently, there's force on the chain/belt perpendicular to the direction of travel. Therefore, the chain/belt needs to be guided in the track to keep it from moving sideways.

With chains this can be done against the side of the hinge where the pin is inserted. With belts this can be done with positioners **7 2 1 7 0 a** or lipped wearstrips.

SIDE TRANSFER

TRANSFERS

◀ back continue ▶

SAFE TRANSFER

This transfer guarantees a safe and smooth transfer for unstable products. It allows the product to continue straight along its original path of travel without requiring it to shift across the conveyor width. Side-flexing chains or belts are required for this configuration.

Can be used for difficult square or oval products. It reduces the pressure on the products while going over the transfer.

Another advantage is no stranded product.

Transfer with belts.

90° TRANSFER

TRANSFERS

To make a 90° turn in a configuration where there is not a large footprint, a **SQUARE TRANSFER** can be used (fig. 1 & 2). SQUARE TRANSFER is also used in case of an off-line accumulation table (fig. 3).

◀ back continue ▶

90° TRANSFER

Transfer with belts.
Go to:

7 2 1 6 6 a

The transfer can be done with a dead plate (fig. 4) or active transfer wing (fig. 5).

Using the System Plast active transfer wing will eliminate the need for a dead plate and prevent product from being stranded or left behind at a 90° transfer. (Image 5)

Stainless steel chain with a transfer wing is available only with K750, either left or right side:

Left transfer wing: SSE815-K750HB-TL, width 190.5 mm (7.5 in)

Right transfer wing: SSE815-K750HB-TR, width 190.5 mm (7.5 in)

For further details on belt with active transfer wing, please refer to section **7 2 1 6 6 a** **7 2 1 6 8 a**

Transfer.
Go to:

7 2 1 6 2 a

The transfer can be done with a dead plate. But the conveyor line can be made self-clearing and the pressure in the path reduced by using the System Plast active transfer wing.

Active Transfer Wings (ATW) are available as:

SINGLE TRACK VERSION OR,

CONNECTED TO FULL WIDTH BELT

The single-track version should be positioned at the transfer section (only the last part of the conveyor) and driven by the same motor as the feeding conveyor:

ACTIVE TRANSFER WING

TRANSFERS

◀ back continue ▶

ACTIVE TRANSFER WING WITH TWO POSITIONERS:

See below overview for the positioning of the active transfer wing relative to the infeed and outfeed conveyor:

This is a system of integrated, tapered flights at the edge of the belt which allows for smooth 90° transfers without dead plates and results in a self-clearing line.

The active transfer system is always equipped with the positioner which ensures an optimum tracking of the belt at the 90° transfer.

We recommend making the return shaft adjustable in X-and Y- direction to obtain a perfect transfer. Alternatively, it's possible to mount the transfer wing belt on an adjustable bed to account for fine-tuning.

1" **3 0 3 3 5 a**

Thermal expansion.

Go to:

7 3 5 2 6 a

The blue line in the principle sketch on page **7 2 1 6 6 a** and **7 2 1 6 2 a** shows that the positioners in those situation should be at the transfer side. Then the position of the belt (and thus the gap between the two belts) at the transfer is fixed. Possible thermal expansion of the belt will be absorbed at the opposite side of the belt.

PT2 configuration is typically not used, especially with wider belts where thermal expansion could cause the belt to get wedged in the guides as the belt expands.

The P2 configuration should only be used when the guides are on the inside of the positioning tabs, again to allow for thermal expansion.

Roller transfer plates,
chains:

7 2 1 7 3 a

Roller transfer plates,
For belts:

7 2 1 7 9 a

The gap between the sprocket and idler can be covered with a dead plate. Depending on the size of the product and the length of the dead plate, it will require some other products to push the first one across the dead plate leaving one stranded on the plate at the end of a product run.

To reduce the length of the dead plate, a smaller sprocket/idler can be chosen. However it is generally recommend to work with medium size sprockets/idlers because of less cordal action and larger number of teeth in operation. Another option is to use a noseover belt for end-to-end transfers. Reference section **7 2 1 8 4 a** for more information on noseover operation.

An option to reduce the pressure necessary to get products across the transfer is the use of roller transfers. Dynamic transfer rollers are not appropriate to be used with small products, due to product instability.

System Plast has 3 types of rollers available:

These modules are designed in sizes with 2, 3 and 5 rollers.

Modules can be bricked side-by-side to achieve larger widths for use with modular belts (like a 6" wide next to a 9" wide to achieve a 15" wide transfer).

Note: the K330 and K450 transfer plates cannot be used in combination with K600 and K900 units due to the difference in overall height.

continue ►

In head-to-tail transfer configuration, dead plates may leave stranded product. Roller transfers modules reduce the friction for an end-to-end-transfer; however, this may not be acceptable for small/unstable products, nor does it prevent stranded containers if the gap is larger than the product diameter or length. The preferred option is a nosebar transfer which allows a very small gap with little to no stranded products.

Nose bar creates extremely short transfers

For nose bar 2120.
Go to product page:

3 0 1 7 5 a

For nose bar 2080.
Go to product page:

3 0 0 2 9 a

The 2120/2121 series belt with 1/2" pitch and concave bottom module is very well suited for nosebar transfers. The small pitch and the concave bottom reduce the polygon effect to a minimum, making for smooth transitions. Either a static nosebar or a roller can be used. The diameter should be 19 mm (0.75 in) in to fit the concave bottom of the modules.

Due to the polygon effect around a small radius, often we can find some chattering noise at the idler side of the nosebar transfer. System Plast has developed a special nosebar that greatly reduces the noise level.

◀ back

SILENT NOSE BAR

STANDARD NOSE BAR

With the new silent nosebar the following advantages are gained:

1. Reduced noise levels by 5 dB compared to standard design and roller design (measured from 1m distance with conveyor speed at 50 m/min (160 ft/min)).
2. Made in Nolu-S for smooth running also at high speeds.

NOTICE: using a too short screw to fix the nosebar can lead to small deformations as below

The issue is easily solved using a long screw. The length of the screw is recommended to be higher than B dimensions.

The screws should be according to UNI 5933 DIN 7991-A Class 10.9

CONSTRUCTION:

There are different ways of supporting a chain with wearstrips:

- parallel support: most common; multiple strands chain;
- full support: in case of heavy load and/or high impact on belts;
- chevron/herringbone: wider belts in abrasive conditions.

Further than physically supporting the chain or belt, wearstrips are important to ensure a smooth running of chain and belt by providing a low friction, high wear and impact resistance surface. These properties are related to the material of the wearstrips.

System Plast available wearstrips materials are UHMWPE, ANTISTATIC UHMWPE, Nolu®-S parts, etc.

Nolu®-S parts reduce the coefficient of friction, reduce the slip stick effect, save energy and has the best sliding properties.

Using wearstrips instead of the steel frame for support have the benefit to provide an easily replaced wear surface.

Wearstrips material datasheets are available upon request to customer care.

5 0 6 0 0 b

CHAINS INFEEED SHOES:

Between sprocket centerline and the end of the wearstrip, the chain/belt can sag since the tension is not great enough to overcome product weight. A wearstrip shoe can overcome this issue by providing full support of chain/belt up to the sprockets allowing smooth transfer onto the wearstrip and reducing noise too.

If the shoe is not an option, the recommended dimension from the centerline of the sprocket to the beginning of the wearstrips is one pitch of chain/belt (e.g. a 815 chain has a pitch of 1.5", so the gap between the wearstrip and the centerline of the sprocket should be no more than one and half inch).

BELT'S WEARSTRIPS

WEARSTRIPS

EXAMPLES OF TYPICAL BELT INSTALLATION WITH WEARSTRIPS:

On the straight track, many existing wearstrip (included wear bed and bar caps) from our extensive range can be used. Go to wearstrips index: **5 0 5 1 0 a**

◀ back continue ▶

When calculating the suitable conveyor width, leave a clearance between belt and outer wearstrip to absorb thermal expansion and belt width plus tolerance. This clearance should be a bit more than the expected thermal expansion (see belt thermal expansion calculation at page **7 3 5 2 6 a**). In the below conveyor drawing (fig.2), the overall clearance is 4 mm (C-B), meaning 2 mm each side.

Since the belts are made with a modular width system of 85 mm (3.3") or 76.2 mm (3"), it is recommended to use this same spacing for the wearstrip/ wear-bed / bar caps arrangement as well. Following above criteria, in below examples the pitch of wearstrips / wear-bed / bar caps (central) is 85 mm. In case of high load or high abrasive application, wearstrips pitch can be less than 85 mm (3.3") or 76.2 mm (3");

In case the product to be conveyed has "feet" or small contact points, the wearstrips should be positioned underneath these points.

For belts with double positioners, bear mindful to leave the appropriate gap (recommended 44 mm) between the adjacent wearstrips where the positioners are located. See below fig. 1:

◀ back continue ▶

FULL SUPPORT:

In case of application with heavy loads or high impact, it's advisable to support the belt completely.

A full support system is a good way to keep the belt from bending/sagging when conveying high load product.

Bear in mind that a full support can also easily collect dust and dirt. Make sure abrasives can leave the system. It's possible to drill holes in the support bed or create a gap from one bed to the next to allow debris to fall through.

For reasons of accessibility we recommend supporting the return way with rollers.

For belts with positioners, a full support can be used but grooves are obviously required for the positioners.

For index wearstrips.
Go to product page:

5 0 5 1 0 a

CHEVRON/HERRINGBONE:

The advantage of this principle is an even wear over the width of the belt, plus it allows the discharge of dirt and abrasive particles from the bottom. Therefore, we recommend this system in abrasive conditions.

The pitch (P) of the wearstrip depends on the application. Use small pitch for high load applications (more support).

Conveyor width (C)	344 mm
Belt width (B)	340 mm
Pitch of wearstrips	100-300 mm

7 2 2 1 5 a WEARSTRIPS FOR CHAINS/BELTS WITH DIFFERENT THICKNESS

WEARSTRIPS

TRANSFERS BETWEEN COMMONLY USED CHAIN TYPES - BELTS:

When a transfer must be made from one chain/belt type to another, a difference in thickness must be absorbed by the wearstrips.

Example: Stainless steel chain 815 to 2250 and 2260M belt:

◀ back continue ▶

The steel chain has a thickness of 3,1 mm (0.12 in) and the 2250 belt of 8,7 mm (0.34 in). That means the wearstrip should absorb 5,6 mm (0.22 in) of difference. See below table.

See table for other combinations:

CHAIN TYPE 1: THICKNESS 3.1 mm (0.12")	CHAIN TYPE 2: THICKNESS 4 mm (0.16")	CHAIN TYPE 3: THICKNESS 4.8 mm (0.19")	BELT TYPE 4: THICKNESS 8.7 mm (0.34")	BELT TYPE 5: THICKNESS 12.7 mm (0.5")

CALCULATION INFORMATION:

Powerflex modular side flexing belts are used to convey packs and boxes. In most applications the load on the belt can be relatively high because:

- The products are heavy
- There is usually no lubrication
- Many times the belts has to make a 180° turn
- In the curve there is only a limited part of the belt (only the outer part) that is pulling.

Therefore, it is important that every application of a side flexing belt is calculated prior to fixing the final layout of the line. It's also important to follow the instructions, especially when designing conveyor with 180° curve with Powerflex belt.

A sideflexing belt conveyor needs to be built precise and stable to make sure it runs smooth and unnecessary extra load is avoided.

System Plast application engineers will be glad to assist you with the calculations and the design of the conveyors.

CONVEYOR OPTIMUM LAYOUT:

When you are implementing a conveyor with a side flexing belt in a layout, there are several things to consider.

We recommend positioning the curve close to the idler end rather than close to the drive side (see below illustration 1). This will reduce the force on the belt in the curve. Once the belt is on the straight section between the last curve and the drive end, there usually is no problem to add some length to the conveyor. On the straight section the strength of the belt is quite high.

For recommendations regarding optimum layout including the minimum straight section before, after and in between curves, see following illustrations:

1- KEEP STRAIGHT SECTIONS BEFORE 180° CURVES SHORT.

In order to reduce the load on the curve and to optimize the service life we recommended to keep the straight sections before curves shorter rather than longer.

FIG.1

Chains & sprockets	Wear strips	Side guide brackets & accessories	Levelers	Engineering manual
Modular belts & sprockets	Chain & belt return systems	Frame & structure supports	Bearing supports	
Curves & tracks	Side guide solutions	Miscellaneous products	Equipment	

2- AVOID SHORT STRAIGHT SECTIONS BETWEEN TWO 90° CURVES.

In case of a 180° curve try to avoid short straight sections between the 90° sections to guarantee a smooth movement in the curve.

◀ back continue ▶

DESIGN RECOMMENDATIONS

Make sure there is enough clearance between belt and guide. An insufficient clearance will lead to unnecessary extra load on the belt. It is very important to build the conveyor frame very accurately and rigid enough to guarantee the same clearance throughout.

STRAIGHT SECTIONS DESIGN:

The design of Powerflex belts straight section is similar to commonly applied standard constructions.

Here you can find some commonly applied standard constructions and recommended tolerances for designing straight sections of conveyor using the Powerflex belts.

Example:
end drive and serpentine return

B = belt width, example 425 mm

C = conveyor width in straight sections = 425 + 3 (inside) + 3 (outside) = 431 mm net (side frame thickness not considered)

C = conveyor width in curve sections = 425 + 5 (inside) + 5 (outside) = 435 mm net (side frame thickness not considered)

Note: A catenary sag is required directly after the drive in the return part

Carry and return part

A possible cross section design of straight carry and return part is this:

For location of TABs and other dimensions refer to catalogue.

Return rollers with rubber coating offer low noise and extended service life.

(Dimensions are expressed in millimeter)

Since the belts are made with a modular width system of 85 mm, it is recommended to use this system for the wearstrip arrangement as well.

On the straight track, any existing wearstrip from our extensive range can be used.

EXAMPLES of wearstrips:

CENTRAL STRIPS

VG-P330CM

VG-U3041M

LATERAL STRIPS

VG-L20M-G-200

VG-J21M-G-200

For good sliding properties Nolu®-S parts are recommended. This reduces the chain pull and extends the service life.

Modular belts & sprockets	Chain & belt return systems	Frame & structure supports	Bearing supports	
Curves & tracks	Side guide solutions	Miscellaneous products	Equipment	

CURVE SECTIONS DESIGN:

There are three options:

1- SOLID MACHINED CURVE:

This can only be offered on request and according to customer's drawing.

Solid machined curve is available for sideflexing belt with width up to 425 mm.

Design principle is similar to existing TAB curves for TAB chains. Here below a different curve design.

2- SIDE GUIDING PROFILES FOR SIDEFLEXING BELTS WITHOUT TAB:

When a belt without TABs is used, it needs to be guided in the curve on both sides.

Aluminum and Nolu®-S guide rail profiles for stable and low friction guiding and supporting of modular side flexing belts.

Minimum radius 457 mm (inside edge).

When designing the curve we recommend to consider the tolerance width of belt plus 10 mm of clearance, 5 mm each side.

3- GUIDING THE BELTS ON THE TAB WITH DEDICATED PROFILES:

Dedicated guiding profile for standard or Heavy duty belt types.

This is fixed to the metal frame construction.

These Nolu®-SR parts are available in 3 meter lengths.

(Dimensions are expressed in millimeter)

CLEARANCE ON THE CURVE SECTION:

In any case, make sure that the belt does not touch the inner edge of the conveyor construction.

A clearance of 10 mm is recommended.

Since the belt is guided at the outside, any width expansion will be transferred towards the inside of the curve.

INCLINED / DECLINED CONVEYOR DESIGN WITH 2351 RUBBER INSERT BELT:

Powerflex belt series 2351 can be used for inclined and declined conveyor. For further details, please refer to dedicated section at page **7 2 5 4 0 a**

MATERIAL

We recommend Nolu®-SR parts for its high wear resistance and at the same time excellent sliding properties.

Other options are:

- Extra strip: A stainless steel wearstrip fitted into a plastic curve. Proven excellent performance in dry applications and dirty environments. See page **7 2 5 1 5 a**
- Standard UHMWPE material: For lubricated applications with low wear expected.

TAKING THE BELT OUT OF THE CURVE:

When guiding the belt on the tab, the construction must offer enough space to lift the belt out of the curve. This guarantees enough space for the belt to be guided properly and makes the installation and maintenance of the belt easier.

A clearance of at least 6 mm for standard belts and 10 mm for heavy duty belts is recommended to move the belt towards the outside of the curve.

Chains & sprockets	Wear strips	Side guide brackets & accessories	Levelers	Engineering manual
Modular belts & sprockets	Chain & belt return systems	Frame & structure supports	Bearing supports	
Curves & tracks	Side guide solutions	Miscellaneous products	Equipment	

INFEED/OUTFEED:

It is strongly recommended to extend the curve tracks into the straight sections in order to run the belt smoothly into and out of the curve.

Modular belts & sprockets	Chain & belt return systems	Frame & structure supports	Bearing supports	
Curves & tracks	Side guide solutions	Miscellaneous products	Equipment	

SPROCKET POSITIONS AND SUPPORTING WHEELS:

Since the teeth of the sprocket are pushing directly against the hinge, the precise sprocket position also depends on the running direction of the belt. The right position for both directions is given in the sketches below. For belt series 2451, 2551 and 2651 the offset must also be considered when the belt curve direction is changed (clock-wise / counter-clock-wise).

Note: Precise position of the sprockets must be determined during the installation to obtain optimum alignment.

SPROCKET ENGAGEMENT AND INSTALLATION:

Sprockets engage on the curved end of the hinges. The teeth of the sprocket must push the highlighted surface of the hinges. That is important for the installation of sprockets.

REVERSE OPERATION:

Special sprockets can be supplied on request.

Middle/standard modules are designed for sprocket interaction. High torque transmission by means of optimized tooth geometry. To avoid the belt from deflecting in areas where there's no sprocket, it is recommended to install a supporting wheel.

FIXED AND FLOATING SPROCKETS:

It is recommended to fix the sprocket which is located closest to the outside track of the sideflexing belt. The other sprockets can be floating using a "Plus bore". See further details at page **7 2 1 3 2 a** or in System Plast SmartGuide.

We recommend to keep all sprockets fixed for belt width up to 510 mm, unless the application is in circumstances with high temperature differences. Consult our technical support in that case.

DRIVES

End drives are the easiest way to drive the side flexing belts. However, centre drives are possible as well. For centre drives some special construction rules apply. Please refer to the relevant chapter in this manual (Page **7 2 1 4 0 a**) for sprocket and idler dimensions.

That means that in one travel direction the sprockets are offset by 0.25" (6,35mm) from the point where they should be for the other travel direction. See below in red circle.

WIDTH [inch]	MINIMUM RECOMMENDED SPROCKETS
3	1
6	2
9	3
12	4
15	5
18	6
21	7
24	8

When the same belt needs to run in bi-directional applications, special sprockets are needed. Please contact our technical support.

On the idler side, the sprockets have the opposite position since the belt pushes against the teeth of the idler.

For further details on sprocket position go to page **7 2 1 2 4 a**

Curves & tracks	Side guide solutions	Miscellaneous products	Equipment	

CLEARANCE BETWEEN TABS AND GUIDE:

Generally, we advise to have total 4 mm free space between TABs and guide

For example: 12" wide belt + 2x 3,5 mm for TABs = 311,8 mm total belt width. Space between guides should therefore be 316 mm

In any case it's very important to make sure that the transfers between straight and curve and between the individual wearstrip sections are smooth and without collision points. And make sure the belt is running free throughout the conveyor.

In case of temperature differences, the thermal expansion of the belt should be considered. Please refer to thermal expansion calculation chapter at page **7 3 5 2 6 a**

Curves & tracks	Side guide solutions	Miscellaneous products	Equipment	

CARRY AND RETURN SECTION:

For straight sections we refer to the corresponding section in the engineering manual about possible return constructions.

Important for the whole conveyor, but certainly also for the return section is that the curve is accurately build. The curve should be a true, smooth curve and not a polygon. The vertical position of the belt support should match accurately with the position of the TAB guide.

◀ back continue ▶

Possible principle construction for curves:

STANDARD BELT WITHOUT TABS AND BELT WITH SLIDER SHOES

Without TAB "C" version

With slider shoe "S" version

3 0 7 3 0 a

2256 Mounting and removal. Go to:

7 3 0 3 5 a

For both belt versions, the load in the curve is carried by the inside guide. The belt is being held down on the outside by the C-shape guide. The outer edge of the belt is running through the guide in the curve and cannot be used to support product.

BELTS WITH TABS "T" VERSION:

The load on the inside of the curve is carried by the TABS. On the outside the TABS are used to hold down in the curve. The full belt width can be used to support the product. The product can also be wider than the belt (considering the product is stable enough).

7 3 0 3 5 a ▶

The load on the inside of the curve is carried by the TABS. On the outside the TABS are holding the belt down in the curve. The positioners underneath can be used to guide the belt from below. The full belt width can be used to support the product.

The flat support of the belt can also be set up using bar cap profiles like 19S00081. For example:

For the return section, depending on the exact construction, an intermediate support is only necessary for a belt width of 12" and wider. Important for the transfer from one guide section to the other and at the entry of the guide profile is a proper chamfer, both in horizontal as well as in vertical direction. For example:

TRANSFERS:

The 2256 series belt has a small 1" pitch, thus making small head-to-tail transfers possible.

The minimum diameter head roller is 50 mm. The minimum advised diameter for the take-up roller after the sprocket in case of a bottom drive is 80 mm.

Except for auxiliary belts, which require their own construction, construction related to the 2253RTC follows general rules for conveyors.

It is recommendable to realize a uniform flat support surface for the balls to run on.

This ensures to keep the same speed of the product in different sections (while running on balls speed of the belt is half).

The support between active and non-active areas can be realized for instance by means of polyethylene, steel or wood plates. The thickness of the support depends on the vertical load to be carried. Important is a flat and stable support.

Different support materials can determine different noise level due to rolling and in friction of balls against support.

Is therefore recommendable to cover the non-active areas with the same material used for the auxiliary belt to keep the same sliding properties. This also contributes to reduce the noise level due to different materials surfaces.

The material of the auxiliary belts should have a good compromise between grip and wear resistance.

As a general rule, polyurethane or PVC coating belts with hardness 70 ShA are suitable.

For a better indication of possible different materials, their performances (maximum speed), as well as minimum thickness of the coating possible, please enquire your belting supplier.

In case of bottom drive configuration a 60 mm nosebar with grooves to accommodate the balls is required.

It is recommended to create easy access to the tensioner of the auxiliary belt since it can be necessary to adjust over the time.

Return part can be equipped with rubber coated rollers to reduce the noise.

DETERMINE SPROCKETS LOCATIONS

Sprockets are possible every inch (25,4mm) according to the available pockets for sprocket interaction at the opposite side of the belt. Minimum recommended number of sprockets as per sketch. Calculate: belt width [inch]/3.

For further details refer to page **7 2 1 2 1 a**

◀ back continue ▶

LOCKING SPROCKETS:

The sprockets and the shaft are loosely fitted in order to absorb differences in thermal expansion between the belt and the conveyor and also installation errors of the belt and the sprockets. However, a shaft collar should be mounted on each side of a sprocket installed around the centre of the belt with about 0.5 mm clearance with the sprocket.

2500 RAISED RIB BELT OVERVIEW

2500RR RAISED RIB BELT

BELT SPECIFICATION

- Pitch:** 50,8 mm (2.00")
- Thickness:** 24 mm (0.94")
- Backflex radius:** 75 mm (2.95")
- Max load capacity (@21°C):** 30000 N/m (2000 lbs/ft)
- Weight:** 9,2 kg/m² (1.88 lbs/ft²)
- Pin material:** Polypropylene
- Belt Material:** Polypropylene (dark grey)
- Open Surface:** 27%.
- Modular width system:**
Imperial -> Standard widths can be made in 3" (76,2 mm) steps from 9" to 150"
- Standard length:**
width ≤ 15": 3,05 m (10.0-ft)
width > 15": 1,02 m (3.34-ft')

Standard material

PPG
Polypropylene

PATENTED

Features of the 2500 RR series belt:

- 27% open surface: raised rib design for an optimum cooling or warming from water flow
- Transfer combs: smooth product transfer
- Travel is truly bi-directional
- Patented special clip design: easier maintenance

APPLICATION:

This 2500 series raised rib belt has particularly been developed for use in pasteurizer tunnels, warmers and coolers. Design and material choice is aimed at high loads and temperatures as is typical in these applications. The standard material is also more resistant to oxidizing chemicals often used in these systems for cleaning.

The System Plast 2500 series belt has an important feature in the pin-clip locking system. It makes installation and maintenance easier and accommodates the belt expansion and contraction better than other retention systems.

Of course, the 2500 series is suitable for other applications, like off-line accumulation tables as well.

NOTE:

This product has specifically been developed for PET bottles and cans.

EQUAL LOAD DISTRIBUTION:

To maximize the service life of the belt, it is important to spread the load on the belt equally.

◀ back continue ▶

GUIDING THE BELT:

If guide positioners or positioning tabs are not used, the belt must be guided on both sides over the full length of the conveyor. To be able to absorb the thermal expansion the belt needs some clearance for expansion. Depending on the expected temperature difference, the structure should be wide enough to make sure the belt will not get stuck at high temperature or, in case of low temperatures, be small enough to still support the belt.

The total clearance at 21°C to be considered is (indicative values):

- 4 mm (0.15 in) for belt width < 500 mm (20 in)
- 6 mm (0.25 in) for belt width 500 to 1500 mm (20 - 60 in)
- 8 mm (0.30 in) for belt width 1500 to 3000 mm (60 - 100 in)
- 10 mm (0.40 in) for belt width > 3000 mm (> 100 in)

Transfer combs

Material: Acetal/POM (dark grey)

Number and position of combs:

The number of required transfer combs depends on the belt width. One comb per each 152.4 mm (6 in) of width is required. For belts with 76,2 mm (3 in) increments, one comb can be cut in half to cover total belt width.

To view the related combs. Go to: **3 0 6 1 5 a**

This image is only for illustration purposes. For these components grey tones are used as standard colours.

The combs should be assembled next to each other. They are designed to have enough free space to shift with the belt as it expands/contracts due to temperature variations. When properly installed, the combs will have a gap of about 1 mm between them. Also, do not affix the combs into place, allowing them to slide as the fingers engage with the Raised Rib Belt and cause them to shift. Shoulder bolts are provided with transfer combs to ensure free movement is allowed.

Molded sprockets are available in several sizes as well and have a multi-angled shape that fits the underside of the belt, offering the best possible support and traction.

To view the related sprockets. Go to: **3 0 6 1 5 a**

Chains & sprockets	Wear strips	Side guide brackets & accessories	Levelers	Engineering manual
Modular belts & sprockets	Chain & belt return systems	Frame & structure supports	Bearing supports	
Curves & tracks	Side guide solutions	Miscellaneous products	Equipment	

MINIMUM REQUIREMENTS TO ENABLE MOVEMENT OF THE TRANSFER COMBS:

- Use the supplied special screws
 - Oversized cuts - chamfers of the inside threads in the support plate should be avoided (see sketch)
- ➔ Requirement: **D < d**

◀ back continue ▶

The special shoulder screws are designed to fix the transfer comb to the conveyor construction, but still allow for horizontal movement of the combs. This is required to follow expansion and contraction of the belt.

Use the two caps, which are supplied with each comb, to cover the long holes. The caps are important to protect the screws and the slots against dirt and debris and create a smooth surface to prevent bottles from toppling over.

The special shoulder screws are made in stainless steel.

For 2250RR belt.
Go to product page:

RETURN PART

Due to the high load capacity we recommend using rollers made of stainless steel which are supported with bearings to ensure proper turning.

Diameter: D = minimum 150 mm

Distance between return rollers should increase towards idler end in order to create equal catenaries throughout the conveyor.

2508 HEAVY DUTY BELT SPROCKETS

The sprockets for 2508 series have a polygonal shape to provide optimum belt support. This is important to reduce stress at the sprocket for belts that have a large pitch and work with very high loads. Machined sprockets with a different number of teeth or a different bore size are available upon request.

FEATURES OF THE 2508 AND 2603 SERIES BELTS

One of the design features of these belts is the clip that retains the pins. Installation of the clip is simple, but more importantly, even in a very dirty application (such as a car wash installation) it is easy to remove the clip by using a screw driver and tapping lightly with a hammer. The clip can be removed or inserted from the top or bottom of the belt and is reusable. It is also positioned away from the belt edge to protect it from wear or damage.

CLIP ORIENTATION

INSERT CLIP

REMOVE CLIP

System Plast® 2508 and 2630 series belts can be used in a variety of heavy-duty applications, but their main design focus was for use in the automobile and car wash industries. With these industries in mind another unique design was created for the installation of pusher bars. The belt modules have mounting holes located on 50 mm centers which match the pusher bar mounts. These holes are identified within the module surface pattern for easy identification and pusher bar installation with M8 bolts. Disassembly of the belt is not required for installation, removal or relocation of the pusher bar.

Very easy to drill and cut M8 thread

Pre defined drill positions

Easy fixation of pusher

Available in grey, yellow and red.

Modular belts & sprockets	Chain & belt return systems	Frame & structure supports	Bearing supports	
Curves & tracks	Side guide solutions	Miscellaneous products	Equipment	

Improved Human Safety: System Plast® 2508 and 2630 series are designed with an advanced nonskid top surface for safety. The "Hexagonal Dimple" ensures safety for people who work on man-ride conveyors, as this provided additional traction for soft-soled shoes. However, it is quite easy to handle a cart with wheels on the belt since the texture is below the main surface layer.

◀ back continue ▶

Other features:

- 1. Hinge design increases pin's service level: better wear distribution due to special design with more hinges which means equal distribution of the stress forces.

MATERIALS 2508 AND 2630

Standard Material: Low Friction Acetal Resin - LFG (Dark Grey)

Low friction acetal resin, silicon free. Standard material for both belt series. Can be used in applications like skid conveyors and car wash installations. Offers low friction, high strength and very good wear resistance. Color of the belt is dark grey. The clips in this belt are made of acetal in waterblue color.

Special Material: Polypropylene - PPLG (Light Grey)

Silicon free Polypropylene. This is the most cost-effective material. Mechanical strength is about 50% of the strength of LFG material. Can be used in less demanding applications. However, PPLG is better suited to applications with chemical attack concerns. Color of the belt is light grey. The clips in this belt are made of acetal in white color.

Special Material: Anti-static Acetal - POM-AS (Black)

Anti-Static low-friction acetal resin, silicon free. This material offers a surface resistivity according to IEC 60093 of 10^6 to $10^9 \Omega$. Can be used in applications where anti-static properties are required like people movers. Also offers low friction, high strength and very good wear resistance. Color of the belt is black. The clips in this belt are made of acetal in yellow color.

Special Material: Electrically Conductive Acetal - POM-EC (Black)

Electrically Conductive low friction acetal resin, silicon free. This material offers a surface resistivity according to IEC 60093 of 10^3 to $10^4 \Omega$. Can be used in applications where an electrostatic charge of the belt must be avoided. Also offers low friction, high strength and very good wear resistance. Color of the belt is black. The clips in this belt are made of acetal in orange color.

Special Material: Flame Retardant Electrically Conductive Polypropylene - PP-FR-EC (Black)

Flame Retardant Electrically Conductive Polypropylene, silicon free. Flammability of this material according to UL94 is classified as V0. It offers a surface resistivity according to IEC 60093 of 10^3 to $10^4 \Omega$. Can be used in applications where an electrostatic charge of the belt must be avoided and where the belt should be flame retardant. Base material is Polypropylene, so the mechanical strength is about 50% of the strength of LFG material. Color of the belt is black. The clips in this belt are made of acetal in white color.

The pins in all LFG, PPLG, POM-AS and POM-EC belts will be made of PBT. Pins in PP-FR-EC belts will be made of stainless steel, AISI 430. On request, also other belts can be made with stainless steel pins.

2080FT - MICROPITCH BELT OVERVIEW

2080FT MICROPITCH BELT

continue ▶

2080FT - MICROPITCH BELT SPECIFICATIONS

The 2080 micropitch belt is designed to allow extremely short head-to-tail transfers (can be used with silent nose bar). The 2080 belt eliminates the need for dead-plates and even enables small products to transfer in-line from one conveyor to the next without tipping. This characteristic makes the belt suitable to be used at shrink tunnel outfeed (see picture 1).

We suggest using this belt only on short conveyors.

Go to product page:

3 0 0 2 5 a

Nosebar dimensions:

ITEM DESCRIPTION	W mm	W in
SNB2080-NS-76H	76,2	3
SNB2080-NS-152H	152,4	6
SNB2080-NS-228H	228,6	9
SNB2080-NS-1200	1200	472

Note: 1,2 m nose bar are supplied WITHOUT holes

EXAMPLES OF 2080 CONVEYOR CONSTRUCTION:

Conveyor Length: usually conveyor lengths are around 800 mm -1000 mm, maximum length is up to 2000 mm.

Recommended Deflection or Adjustable roller diameter is 50 mm.

Deflection/Adjustable roller must be made of a solid/rigid round bar of PE, PA or steel.

The deflection roller should always be parallel to the sprocket/s to guarantee an uniform contact between belt and sprocket and so avoiding premature belt breakage.

The tensioning force should be between (gravity take up or adjustable deflection roller): 50 - 100 N (11.24 - 22.48 lbs.) per belt meter width depending on the load and the layout.

Sprocket wrapping angle = 140° +/- 10° "

BELT MOUNTING AND REMOVING INSTRUCTIONS:

Please refer to mounting and dismounting instruction of belt with clip at page **7 3 0 3 1 a**

2502DT - DRAINING TOP BELT SPECIFICATIONS

This belt is designed for filtering purpose specially in pasteurizer application. The belt specifications are below:

Belt Pitch: 2" (58.8 mm)

Thickness: 0.5" (12.7 mm)

Back Flex Radius: 2.36" (60 mm)

Max. Load Capacity: 3000 N/m (205.5 lbs/ft)

Belt width: 525 mm, increments of 75 mm are possible

Drainage windows: square 4x4 mm max

Drainage flow rate: 150 m³/h (91 gal/min.)

Open Area: 37%

Belt Weight: 2.55 kg/m for 525 mm width

Standard Belt Material: Polypropylene white

Operating temperature: 20°C - 80°C (68°F to 176°F)

Chemical resistance: water with dilute chemicals as per standard pasteurizer application (for further details refer to page **7 3 5 8 6 a** - chemical resistance of standard materials)

Standard Pin Material: Polypropylene;

SPEEDSET™ BRACKETS

CONVEYOR COMPONENTS

◀ back continue ▶

SPEEDSET™ BRACKET IN THE CURVE:

SpeedSet™ brackets can also be used in curves. The guide rail in the curve must be a separate piece from the guide rail on the straight end. Also, an extra jointed adaptor (hinge) and brackets with a swivel head must be used to mount the SpeedSet units parallel in the curve. The SpeedSet units must be parallel to allow for adjustment. See the diagram below.

For speedset™.

THE POSITION OF THE SPEEDSET™ UNITS:

The distance between the brackets is recommended to be **800-1000 mm (32 - 40 in)**, depending on the flexibility of the guide rail and the pressure from the products. If you are replacing an existing system, simply utilizing the existing bracket spacing should be sufficient. The system is designed so you can walk alongside the conveyor and change the position of the guide rail, one bracket at a time. Enough flexibility is needed to reset the SpeedSet™ units one after the other. A SpeedSet bracket has limited flexibility because it also needs to hold the side guide.

◀ back continue ▶

For speedset™.
Go to product page:
5 3 5 9 5 a

Speedset™ bracket application. Go to:
7 2 5 9 0 a

When the guide rail goes across a sideways transfer, the rail itself can be 1 piece because the SpeedSet units remain parallel. However, the SpeedSet™ units should always be positioned before or after the transfer where the guide rail is straight and not bent. If a bracket is needed in the curve area of a sideways transfer, use a jointed SpeedSet brackets rod adaptor so the SpeedSet bracket can remain parallel with the other brackets in line.

Take care when positioning SpeedSet™ brackets, as additional space is necessary to accommodate for adjustment. The brackets must have range of motion for the adjustment, and enough accessibility so an operator can make the adjustment.

If the SpeedSet brackets are not aligned in parallel, the guide rails will be difficult to adjust. Care must be taken to ensure all brackets and rods are parallel with one another.

Speedset™ bracket application. Go to:

7 2 5 9 0 a

In short, the Speedset™ units should be parallel, spaced sufficiently and be well-aligned with the clamps holding the guide rail. The Speedset units must have enough room to adjust. The guide rail itself needs to be stable, straight and/or bent properly. Instead of affixing everything as tightly as possible you need to leave room for adjustment.

THE SPACERS:

A key element of the Speedset bracket system is the spacers. They set the relative position of the guide rail for each product size.

The QSC style spacer is available in different lengths and different corresponding colors. The QSC spacer can be used to achieve 3 different adjustments with just one spacer.

The total Speedset unit is fixed with an eyebolt and nut. The absolute position is set with this eyebolt/nut.

Clip-on spacers for Speedset™ bracket

Can be connected to the bracket or the machine with the VG-QT-01 tether.

TRANSFERS:

Guide rail transfers in/out curve:

If adjusting a conveyor section with a 90° curve, the curved rail section must be adjusted at a 45° angle. See below:

◀ back continue ▶

For speedset™.
Go to product page:
5 3 5 9 5 a

Speedset™ bracket application. Go to:
7 2 5 9 0 a

This means that the outside curve section moves away from the straight section when shifted to larger product diameter.

Gap G needs to be bridged to ensure smooth product guiding.

To cover gap "G" there are standard guide rail bridge kits available. Refer to SmartGuide® catalogue at page **5 1 8 2 0 a**

We always recommend making the transfer from the straight section to the curve section and back about 100-200 mm (4 - 8 in) before and after the curve (100-200 mm [4 - 8 in] straight at the in- and outfeed of the curve).

Bridge kits can also be used to fill the gap using the same guide rail as is used throughout the conveyor. These may be necessary if thicker rails than the SSR are used with the Speedset™ bracket.

SPEEDSET™ BRACKETS

CONVEYOR COMPONENTS

If the guide rail is sufficiently tall, cutting it at a shallow angle (30°) will give enough horizontal room to cover the gap in the outer (widest) position of the guide rail in most cases. In this way the product will always be guided.

RADIUS OF GUIDE RAIL:

In theory, when adjusting the guide rail in a curve you would want to also adjust the radius of the guide rail.

Instead of the guide rail radius A you would theoretically want radius B.

In practice, however this is hardly ever an issue because the guide rail itself needs to be stable and is –partly- made of stainless steel. Therefore, you cannot change the radius.

Also, the differences in product diameter tend to be relatively small, so the difference in radius is also small.

If (like just in front and after the machines) the product needs to be guided on the centre of the chain the difference is divided between left and right and thus even less.

In practice, these differences are ignored. Important thing is to set the transfers right.

If for whatever reason it is necessary to adjust the radius a few options are possible.

1. Guide rail with the stainless-steel backing (like the VG-LSSR) only where the clamps are. The rest is plastic only and thus flexible. This is only possible with light weight products.
2. In the case of roller guides, the flexible SpeedRail™ roller guide (VG-687FLEX) can be used.
3. Any other flexible and still sufficiently stable custom-built guide rail.

Depending on the radius of the curve 2 or 3 brackets are supporting the guide rail. For adjusting also the radius you need at least 3 brackets. The 2-outer set the distance. The one in the middle determines the radius.

FURTHER CONSIDERATIONS:

With SpeedSet™ bracket, the guide rail is not fixed. It can be moved and adjusted on a regular basis. That means the guide rail itself must be stable, straight and/or well bent. The guide rail cannot be forced into position anymore by the brackets. This is a major difference in thinking which should not be underestimated.

The guide rail needs to be positioned with a high accuracy as done with fixed guide rails, because of the desire for small tolerances on the different relative positions. That means smaller tolerances are needed on the absolute positioning.

With the usual fixed side guide, it's less important how accurately the brackets are positioned relative to the clamps on the guide rail. Especially when using a bracket with swivel head it can always be made to fit. With SpeedSet bracket however the clamps and brackets need to be aligned properly to ensure smooth movement of the SpeedSet bracket units when changing the position of the guide rail.

Obviously when adjusting the guide rail on 1 side, it's also very important that the opposite fixed side is stable, straight and/or well bent and accurately positioned.

Cleaning:

When a line equipped with SpeedSet bracket gets cleaned, attention should be paid to proper rinsing. Foam cleaners in particular have the tendency to get in between the outer sleeve and the inner adjustable rod. When the system is rinsed properly the SpeedSet bracket unit remains easy to move back and forth.

Occasionally, applying some oil may between the inner and the outer part of the SpeedSet bracket unit may be necessary to keep it moving easily.

SpeedSet bracket can also be used for vertical setting of a top guide. In this case attention should be paid to the weight of the guide relative to the strength of the spring. In certain special cases, the SpeedSet bracket unit may be adapted to a heavier top guide. The spacer and the spring will then change position.

Important with crate conveyors is to have the conveyor construction as open as possible to get rid of the dirt and the debris.

NOTICE Keep safety in mind. Use proper guarding to prevent pinch points.

GRIPPER CHAINS

GRIPPER CHAINS & SELECTION OF GRIPPER VERSION

When designing and building conveyors with gripper chains please consider the following:

- Chain tracks must be adjusted parallel. The tolerance for the parallel adjustment of the tracks is < 2 mm (0.08 in). Incorrect adjustment can lead to overloading and a high wear of gripper-flights. It will also reduce the life of the bearings, sprockets and flights for the entire system. Ensure the right gripper is selected for your application.
- Gripper ribs must be oriented backwards relative to the running direction of the chain, as shown in the picture below. This will ensure proper gripping force.

continue ►

- The control system of the conveyor must assure that no backline pressure is created to avoid damage at gripper chains.
- The clearance between the chain tracks must be adjustable. Gripping forces must be adjusted according to the product.
General rule: as tight as necessary, as loose as possible.
The product should be removable by hand WITHOUT excessive force.
- A tensioning system is necessary. Tension should just take the play out of the chain. Make sure the chain is not over-tensioned to avoid unnecessary load or premature wear.
- Touching products must be avoided - particularly in curve sections. Speed/timing is critical to ensure products remain properly gapped.
- Lubrication helps to extend the service life of the chains as well as of the chain guides. Make sure only the base roller chain and flight-curve/wearstrips are lubricated with compatible lubricants. The rubber used in the grippers is susceptible to chemical attack from lubricants, so be sure to check with application engineering for chemical compatibility.
- EXTRA style curves with the stainless-steel strip can increase the service life of the curves. Turn discs are also an acceptable alternative in high-speed, high-load applications.
- Gripper chains have the main purpose to elevate or lower a product between two parallel strands. Both chain strands must run at the same speed. Any speed differential causes damage at the chain and possibly to the product. One central drive is recommended.

GS1: The longer finger allows a better control of the holding pressure on the product.
Suitable for: Soft containers such as empty PET bottles (also D shape), empty cans, non-pressurized containers.

GS2: The shorter finger allows a very stable setting of the holding pressure.
Suitable for: Round, solid containers such as glass bottles or pressurized containers, empty crates.

GS4: The shape of the gripper increases the holding surface thus allowing a better distribution of the pressure on the product.
Suitable for: Small containers, empty PET, light weight, fragile, flat surface and large, round container (jugs, boxes).

Depending on the application and the facility, noise can either be a small annoyance or a large nuisance. The severity may require action to be taken to address the source - it may not be a simple solution! There are different noise sources possible on conveyors:

- 1 - Rattling noise generated by running chain/belt
 - a. This may frequently be due to poor return set-ups and too many pitches of chain/belt in the system
- 2 - Squeaking generated by curves: under certain circumstances, the sliding of the chain/belt through a curve can lead to resonance, which causes a squeaking noise. Resolve this by:
 - Cleaning the curve
 - Using curves and wearstrips made of Nolu®-S parts
 - Changing speed/load
 - Using NG®evo conveyor components made from engineered plastic resin chain/belt material
 - Lubricate

Contact our technical support for further assistance.
- 3 - Noise generated by product impact. Especially glass bottles hitting one another generates a lot of noise.

The following are suggestions to help reduce conveyor generated noise:

- Use plastic chains/belts instead of steel chains
- When the application permits, use multiple strands or a wider belt running at a lower speed, rather than single strand or narrow belt running at higher speeds
- Avoid chain/belt obstruction with conveyor parts
- Ensure catenary adjustment is correct
- Reduce speed differentials and thus product impact
- Use chains/belts with a smaller pitch (e.g. 2120/2121 belt series)
- Use sprockets with a greater number of teeth
- Adjust sprockets/idlers according to the proper "S" dimension (Image 1)
- Use chain infeed shoes at drive and idler transition (Image 2)
- Use noise-absorbing rubber-coated return rollers or serpentine system for full chain/belt support (Image 3)
- If using a noseover transition, consider using a silent nose bar instead of the standard version (Image 4)
- Use larger diameter return rollers which reduces rattling noise
- Use NGE chain/belt materials (optimized sliding properties) and Nolu®-S wearstrips, product guides and curves
- Use curves instead of dead plate transfers to reduce product impact noise
- In certain applications, lubrication can help to reduce noise
- Align straights to curves
- Appropriate setting of conveyor controls

INCLINED AND DECLINED CONVEYORS

continue ►

INCLINED AND DECLINED CONVEYORS:

To avoid products sliding down, a flat top chain/belt can only be used below a certain maximum inclination/declination angle. General guidelines on this maximum angle are reported in below table. When the conveyor inclination/declination angle is more than stated value on a table, the use of rubber top chain/belt is required. Be aware that rubber top chain/belt also has a maximum angle. See also below table.

CHAIN TYPE	LUBRICATED		DRY	
	GRADE	PERCENTILE	GRADE	PERCENTILE
Stainless steel	3°	5.2 %	6° (1)	10.5 % (1)
Plastic chains/belt	2.0°	3.5 %	3°	5.2%
Rubber top chains steel/ plastic	12° (2)	21 % (2)	15° (3)	26 % (3)

Return part construction-chains.
Go to:
7 2 1 4 4 a

- (1) Dry run with steel chains is generally not recommendable.
- (2) wet circumstances: wet carry over from lubricated section.
- (3) Dry rubber top

Debris on the chain as well as on the product surface influences the maximum angles negatively as well as the effects of speed, conveyed goods, center of gravity, mass. For example, carton dust can settle in the rubber material and reduce the grip.

DRIVE CONSTRUCTION:

Location of drive in order to run chains safely and without issues.

For a suitable design of incline and decline conveyors, we recommend following below designs features:

Declines:

In case of a declined conveyor, the drive should be located at top or bottom of the conveyor, depending on angle β .

$\tan \beta > \text{COF chain-wearstrip}$

1 - When $\tan \beta > \text{COF chain-wearstrip}$, the drive should be on the top to avoid the chain/belt sliding down faster than the sprocket pulls.

Example: a 9° declined conveyor, $\beta=9^\circ$ with NGE chain and Nolu®-S wearstrips;

$\tan \beta = \tan 9^\circ = 0.158$

COF NGE chain- wearstrip = 0.13

$\tan \beta > \text{COF NG}^\circ\text{evo chain- wearstrip} \rightarrow$
the drive to be located on top.

2 - Depending on the length, speed and load a standard catenary sag may be sufficient or a tensioner may be needed at the lower side of the conveyor.

NOTICE Soft start and stop is always recommended

7 2 5 4 1 a INCLINED AND DECLINED CONVEYORS

$\tan \beta < \text{COF chain-wearstrip}$

When $\tan \beta < \text{COF chain-wearstrip}$, the drive should be on the bottom.

Example: a 6° declined conveyor, $\beta=6^\circ$ with LF chain and PE wearstrips;

$\tan \beta = \tan 6^\circ = 0.105$

$\text{COF LF chain- wearstrip} = 0.2$

$\tan \beta < \text{COF LF chain- wearstrip} \rightarrow$ the drive to be located on the bottom.

Recommendations about wearstrips, return roller and design construction can be found on CONSTRUCTION DETAILS SECTION. CONSTRUCTIONS DETAIL INDEX **7 2 1 1 0 a**

NOTICE Soft start and stop is always recommended

Inclines:

Drive is normally located at the upper end.

Soft start/stop is recommended.

If the construction is with catenary sag, we recommend locating the catenary sag after the drive shaft.

INTEGRATED TRANSFER IN INCLINED CONVEYOR:

In case of rubber top belts, we recommend using side-indent version to guide belt thru the upwards curve.

SEPARATED TRANSFER E.G. WITH DEAD PLATE IN INCLINED CONVEYOR:

In case of rubber top belts, avoid speed differences before-after the transfer, otherwise premature wear of the rubber top may occur.

LBP ACCUMULATION

Accumulation of products results in increased load on the chain and increased pressure on the product.

LBP (Low Back Pressure) chains/belts are recommended to reduce these effects.

For the return part construction, flat support or guide shoes are recommended.

ROLLER SIDE GUIDES

Commonly where carton or shrink-wrapped products are conveyed, a roller side guide is recommended to reduce the risk of damaged packaging material.

When an LBP chain or belt is used also the side guide needs to be a roller guide to make sure the friction on the side of the pack is not higher than underneath the pack.

There are different roller guide tracks for both side and center guide:

- Full plastic (side only)
- Aluminum
- Stainless steel

For full details we refer to the product pages of the Smart Guide® catalog.

Two main versions are available:

SpeedRail™ aluminum rail with bead rollers. The pearl shape of these rollers is particularly suitable for shrink-wrapped packs.

Roller product.
Go to product page:

5 2 5 1 0 a

A second version that is completely flexible allows a variable radius or a twisted roller guide. In this case, the support rail is a flexible plastic (PVC).

DRY LUBRICATION:

There are several developments concerning lubrication.

The trend is to go away from wet lubrication to either semi-wet lubrication, dry lubrication, or completely dry (no lube at all).

In some industries and situations wet lubrication is still the best and easiest lubrication system.

In a growing number of cases semi-wet lubrication or dry lubrication can be used. System Plast® products incorporate designs and materials that can handle applications completely without lubrication. Our **NG®Evo conveyor components made from engineered plastic resin** for chain/belt and Nolu®-S wearstrips are commonly used in dry run applications.

Semi-wet lubrication is a fluid, but it should not be mixed with water before applying. This system tends to be used more on stainless steel chains than plastic.

Dry lubrication is most often a mineral oil with a built-in lubricant like Teflon®* or silicon. The amount of dry lubricant that is applied is typically very minimal. It forms a thin layer on the chain/belt to get the required sliding properties. Advantages are: a small amount of lubricant required; no water; no waste water; simple installation; no drip trays, etc. Dry lubricant is presently used mainly with cartons, bricks, PET bottles and cans at normal line capacities.

There are several using different products and applying it in different methods. Several are shown below:

BRUSHES

SHOES

* Teflon is believed to be the trademark and/or trade name of The Chemours Company FC, LLC and is not owned or controlled by Regal Beloit Corporation.

NOZZLES:

Although the different suppliers suggest different ways of bringing the lubricant to the chains/belts, the basic principle is the same as the flow diagram below:

The real challenge with dry lube is how to evenly apply about a small amount of lubricant (around 5 ml/hr) on the chain/ belt.

Dry lubrication can bring advantages like:

- Reduction of cost for waste water
- Reduction of cost for dosing hardware - no drip trays necessary
- Safety: when properly dosed, there are no slippery floors due to foam from wet lubrication
- Hygiene: less or no water; no slime build-up when dosed properly
- No corrosive attack on equipment
- No false rejects due to foam on bottles at inspection points
- No water/foam on labels
- No moisture on packaging material

Curves & tracks	Side guide solutions	Miscellaneous products	Equipment	

It is important to use it correctly. Dry lubrication requires a different mind-set compared to wet lubrication:

- Wet lubrication requires a minimum
- Dry lubrication requires a maximum (smallest possible; when you see it, it's already too much)

◀ back continue ▶

If the dry lubrication is not optimized, after some time the chain may have build-up of wear paste like this:

That's why it's very important to take a couple of things into consideration:

Dry lubrication requires maintenance to avoid built-up of debris, regardless whether it's a system with brushes.

DRY LUBRICATION

DRY LUBRICATION WITH SHOES

DRY LUBRICATION WITH NOZZLES

The responsibilities for maintenance and the lubrication must be clear and preferably with the same person that's technically responsible for the line. Proper cleaning methods must be followed to ensure the wear paste doesn't build up and develop into a new issue altogether.

Dry lubrication has a high potential, but to get the full benefit it's good to take also following effects into consideration:

	CLEANING	PRODUCT QUALITY	PROCESS	MECHANICAL	FACTOR H
Dry running	<p>MORE DEDICATED ↑ END USER</p>	<p>HIGHER INFLUENCE ↑ END USER / OEM</p>	<p>ENGINEERING MIND SET ↑ END USER / OEM</p>	<p>DETAILS ARE IMPORTANT ↑ OEM</p>	<p>HUMAN FACTOR ↑ END - USER</p>

DRY LUBRICATION

◀ back continue ▶

CLEANING:

The cleaning regime needs to be re-evaluated when going away from wet lubrication because:

- Wet lubricant has also cleaning/rinsing effect
- More dedicated cleaning is required where product loss occurs

PRODUCT QUALITY:

The type and quality of the material has an influence on the behavior of the conveyors, such as:

QUALITY OF PET	QUALITY OF CANS	QUALITY OF GLASS
Raw Material	Steel/aluminium	Raw material; origin
Colorants	Painted or varnished	New or returnable
Blockers	Design	Design
Other additives	Material thickness	Surface finish of bottle
Design/ settings of machine		

PROCESS:

When designing a layout please bear in mind the line is going to run without wet lubrication. Consider:

- Wider conveyors → slower speed
- Longer inliners/outliners (i.e. combiners/decombiners) to allow product to nest properly
- Shorter buffer sections → Backline Pressure
- Optimized line controls
- Larger radius curves
- Short straight section before curve instead of long straight section
- In case of high speed and load, split 180° curve in two drives with one 90° curve per drive
- Locating curves at the beginning of a conveyor line where there is less chain tension
- Accessible conveyor frames for easier wash-down between product runs
- Low coefficient of friction chain/belt and wearstrip materials

MECHANICAL:

Some small mechanical issues on conveyors that seem harmless must be addressed when going away from wet lubrication. Make sure that the chains/belts are running freely without obstructions. Some points of attention:

- Nolu®-S wearstrips and curves with built-in lubricant can replace wet lubrication in some cases
- Perfect alignment of different sections
- Smooth wearstrips transfers
- Stable and straight guides rails at correct orientation
- Positioning of sprockets and idlers with correct shaft drop and location within sprocket pockets
- Smooth transfer from straight to curve sections

FACTOR H:

The most important factor is the Human Factor: the people that are dealing with the line.

- How do maintenance and operators deal with the line?
- Who's responsible for maintaining/cleaning the line?
- How are the contracts made?
- 'Mind set' change when reducing lubrication!
- Never mix products! → e.g. Teflon®* spray in combination with dry lubricant creates a high-friction paste
- Are they well trained on how to run with dry lubricant?

SO, IS DRY LUBRICANT A GOOD IDEA?

- Yes, in many cases it brings desirable advantages
- Be aware of the limitations and requirements to get the full benefit!

COMPLETELY DRY MAY BE BETTER?

In certain areas of the bottling line and certain products - Absolutely!

- Depalletizer + outfeed conveyors
- Labeling, coding and packaging areas
- Cans and PET and even glass
- Beware of abrasives & chemicals

System Plast continues to develop products and materials that can run completely dry in certain applications, such as:

- Nolu®-S parts (wearstrip / curve / side guide)
- NG®Evo conveyor components made from engineered plastic resin
- 828 chain design
- Maintenance free bearings and TPM/SMED products that require less attention.

In any case, since every situation is different, please contact our technical support to discuss.

* Teflon is believed to be the trademark and/or trade name of The Chemours Company FC, LLC and is not owned or controlled by Regal Beloit Corporation.

DRY RUN CONSIDERATIONS

DRY RUN CONSIDERATIONS

With the continuous demand of fresh water due to world population increasing, bottling companies need to be sustainable and reduce the water consumption and the amount of waste water.

Besides the industry challenge is also to reduce the energy consumption and downtime while enabling greater efficiency. Other important aspects are Safety, Hygiene and the Total Cost of Ownership (TCO).

Fortunately, with new materials designs and the experience gained in the field, System Plast's team can provide full support to OEM and End-user to achieve this challenge through RUN DRY.

With run dry specially developed materials and smart design chains, belts and components are used. Using these New Generation technologies, bottling companies can eliminate the problems associated to water and lube consumption including safety, corrosion, and excessive rejects and reduce power consumption. At the same time, costs are reduced and sustainability is improved by cutting water usage and water reclamation costs and energy consumption.

When switching a line from water/soap lube or dry lube, some considerations must be done according to the type of line and to end-user requests.

Based on many years of experience We has defined following **5 steps** in the process to switch to a line running without any lubrication:

- Step 1. Awareness.
- Step 2. Cost advantage
- Step 3. Engineering
- Step 4. Proposal
- Step 5. Implementation

There is consensus about the benefits of a run dry operation:

- Save costs on water consumption and use of lubricants.
- Improves safety: no slippery floors.
- Higher hygiene standards: less bacteria growth in a dry environment.
- Less/no drip trays needed.
- Easier access for maintenance
- Less corrosion attack on equipment.
- No false rejects due to foam on products at inspectors.
- No water / foam on labels.
- No moisture on packaging material
- Less energy consumption

STEP 1. AWARENESS:

First and foremost, it's important to create awareness. Are the implications of dry running understood and is the will there to do the necessary to make it work well? That means not only at management level, but also and even more so, at operator/ maintenance engineer level.

It's important to understand that:

- It is more than just switching off the lubrication.
- It is more than just changing the chain or belt.
- It requires a new balance for different aspects of the operation.
- It requires a different mind-set at all levels to make it work.
- And practice has shown that it can work!

When running the line without lubrication a new balance in cleaning needs to be found and maintained. The parts of the line that are really dry, generally require less attention and cleaning. The sections that are (semi) wet require more attention and cleaning (for instance exit of pasteurizer or filler).

Modular belts & sprockets	Chain & belt return systems	Frame & structure supports	Bearing Supports	
Curves & tracks	Side guide solutions	Miscellaneous products	Equipment	

There are 5 steps in the process. There also 5 key factors that have been defined which will be explained in more detail below:

1.1 CLEANING:

Every line requires its own cleaning regime. Every situation is different with respect to product to be bottled, quality of containers, type of line, local circumstances, etc. Of course there are some general rules, but it's very important that a balance is found and maintained in cleaning the line. It is important not to drag the product spillage around the line but to try to keep the product spillage as close as possible to the filler. Generally, there's enough equipment and attention for cleaning around the filler. Further down the line it's more difficult and there tends to be less attention to cleaning.

From experience, we know that running dry has a good influence on cleanliness; less cleaning effort needed but smarter, more focused. Especially the bacteriological situation improves significantly. "Bacteria can swim, but can't crawl". There will be less slime build up and less issues with for example minerals from rinsing/cleaning water.

Therefore, we strongly recommend having a proper shower at the filler discharge, especially when running sugar containing products.

We suggest putting a blower after the shower to remove the excess water (including dissolved product/sugar/etc.) in order to get the line fairly quickly as dry as possible which is the preferred situation: the dryer, the better. As a general rule, the first 3-4 conveyors after the filler/seamer (including the outliner) are connected to the CIP system of the filler/seamer. In that way, they are automatically cleaned every time the filler/seamer is cleaned.

When cleaning the line it's -as always- important to follow the recommendations from the cleaning agent supplier and to make sure that the cleaning agent is rinsed off completely, also in between carry and return. The used water should be soft to avoid a buildup of minerals when the water has evaporated. In some cases the product to be bottled or canned has a high mineral content. Residues contain calcium and other minerals that can be very abrasive and cause increased wear of components. The more reason to have a proper shower and blower right after the filler/seamer exit to avoid carrying the minerals around the line.

In case of cans, and especially with beer, there tends to be quite a bit of carry thru from the seamer. The shower after the seamer is therefore more or less standard. Automatically the first couple of conveyors will therefore be wet with water. Also in this situation, ideally, the excess water is blown off shortly after the rinser.

In situations where the product is being bottled or canned at lower temperature there will be condensation water on the bottles causing the sections after the filler to be unavoidably wet. This is what we call process water and is not a problem. Also after a bottle washer and pasteurizer/warmer, the first sections will be unavoidably wet.

With glass bottles, normally speaking a flat top belt is used, but it can be considered to use a flush grid belt between filler and pasteurizer if that help cleaning also the inside of the conveyor frames. Of course the CIP system needs to match with this concept of an open belt.

The pasteurizer is expected to have a blower at the outfeed. If not we recommend to install one there to carry thru as little as possible water also at this position in the line.

Smart cleaning instead of more cleaning, that is the basic approach. Do cleaning where and when necessary like when bottles or cans appear to leak or when glass bottles break.

1.2 PRODUCT QUALITY:

The quality (properties) of the material of the containers influences the behavior on the conveyors. These influences always need to be taken into consideration, also when creating a dry running line. Where a poor mobility of f.e. low quality PET bottles was 'compensated' with soap, it now may show different behavior without the soap.

- Quality of PET
 - Quality of raw material
 - Colorants
 - Blockers
 - Other additives
 - Design/ settings of blow molding machine
- Quality of Glass
 - Raw material; origin
 - New or returnable
 - Design
 - Surface of bottle
 - Coating or not
- Quality of Cans
 - Steel / aluminum
 - Type and quality of varnish
 - Design
 - Material thickness

Points of attention are the behavior on inliners/outliners. Especially returnable glass bottles (pool system) may have a poor mobility (glass against glass) and thus require more time to get in line.

There's a large difference between one PET bottle quality and the other. Many factors influence the mobility of these bottles and the current fancy designs can make them quite instable.

Modular belts & sprockets	Chain & belt return systems	Frame & structure supports	Bearing Supports	
Curves & tracks	Side guide solutions	Miscellaneous products	Equipment	

1.3 PROCESS:

The process is basically about the layout of the line and how it is set up.

When designing a new line for running dry, it's good to think about these items as well:

- Wider conveyors → slower speed
- Keeping the curve close to the idler wheel
- Maximum 90° curve per drive in high speed single line
- Infeed/outfeed of machines rather straight than sideflexing
- Somewhat longer inliners/outliners if required
- Blowers/dryers only over straight running conveyors (no minerals build up in curves)
- Shorter buffer length per drive → less back line pressure
- Optimized line controls
- Curve instead of square transfer with instable bottles
- Side guides with lower friction and easier to adjust

When it's a retrofit, of course the layout is fixed. In this case we tend to look at transfers, side guides, etc. to optimize where possible to reach the highest efficiency.

An important part of the process is also the correct material choice. In fully lubricated situations the material choice is less determining for a proper running of the line. Under dry circumstances it's one of the most important choices to make. Running dry asks for low friction material and a high wear resistance. Besides, chemical resistance helps to make cleaning easier. System Plast proprietary NGE material offers these advantages in these conditions and also produces hardly any dust (avoid issues with inspectors).

In combination with saving water it is important to save energy. Nolu®-S wearstrips offer that advantage. We have measured 10,8% less amperage on this combination compared to NGE on standard green wear strip. When installing new belt/chain we recommend to also install new wearstrips anyhow.

In dry circumstances, it is very important to reduce friction in curves. This has to do with power consumption and wear life. Also in these positions Nolu-S(R) wearstrips has a proven record to be the optimum solution.

Optimization of the controls is always important to balance the flow of bottles, to reduce the accumulation pressure and to reduce the time the belts are running under full accumulation (service life elongation). When the controls are set correctly there will be less pressure on the bottles, less pressure on the side guides, easier transfers, etc. Experience has shown that a proper programming philosophy, is key to a smooth and efficient running line.

A proper position and good condition of side guides is needed to maintain a smooth flow, especially at more critical positions like transfers and pressureless combiner (inliners/Outliners). Here a Nolu-S side guide will reduce friction against the bottle/can and help a smooth conveying. As an additional advantage, it has a proven record to avoid marks on delicate cans.

Return rollers are ideally rubber coated to have enough grip on the belt. They will keep rotating better and longer to make sure the top surface stays in good condition.

Every project can be assessed individually, but we generally advise to use a belt rather than a chain because it offers optimum product support and is a more rigid solution which is an advantage in potentially tougher environments.

In the case of aluminum cans, the presence of aluminum oxide coming of the cans (especially when the chemical balance in the pasteurizer is not optimum) asks for the use a belt with an open structure so the abrasive aluminum oxide can evacuate directly or at least during cleaning.

In case of glass, it's important to create escapes in the side guide to avoid big chunks of glass getting stuck under the side guide. Also at the drive end it's important to create an open end so pieces of glass can escape.

1.4 MECHANICAL:

Already under wet circumstances, but certainly under dry circumstances it's good to make sure the conveyors are mechanically in order. Often you find a chain running against a part of the conveyor like for example a cable tray or a protruding bolt/nut.

- Perfect alignment of conveyor sections.
- Smooth transfers wearstrips.
- Stable and straight side guides at right position and angle.
- Proper positioning sprockets and idlers.
- Smooth transfer straight into curve.

A special attention should be paid to the quality of the installation: there is no more lubrication to cover up small misalignments which can lead to bottles tip.

DRY RUN CONSIDERATIONS

1.5 FACTOR H:

Very important and decisive is the human factor. Awareness needs to be created at both management as well as operators: they should be aware of the do's and don'ts, the benefits of run dry and receive a dedicated training that Regal can provide.

It is important to start looking at the conveyors with a 'different eye'. When the operators and maintenance people see or hear something on the line, they should focus on resolving the root cause and not even consider adding any lubrication.

Ideally someone makes a daily short round around the line to watch and listen if everything is still running fine. When you build up such a rhythm, you will see deviations quicker and you're able to resolve them quicker.

STEP 2. COST ADVANTAGE:

Converting the pro's and con's into money. Calculate the real savings.

Things like hygiene and safety may be hard to translate into real money, but the savings on water and soap are generally quite significant.

Often the Return Of Investment (ROI) of switching from wet lubrication to completely dry is 1 year or less depending on the situation. If the ROI calculation is made for a new line, the marginal extra cost for the premium solution with NGE and Nolu®-S wearstrips is many times compensated by the fact that you don't need dosing hardware and drip trays. When an existing chain is still in good shape and has several years of service life left, you need to take this into consideration so the ROI can be a bit longer, for instance 1,5-2 years.

STEP 3. ENGINEERING:

During this step, a technical feasibility study is done. Checking the handling of the products in detail. Checking loads and speeds of chains/belt. Checking PV limits, transfers, wet / semi wet / dry sections, etc. Specific situations like twisters, in/outfeed of machines, conveyor length, etc are analyzed and a solution proposed if necessary.

In some cases, it may be necessary to do an on-site audit to fully understand the situation and to be able to give the correct recommendations.

It's important to discuss details of a project between OEM, EU and System Plast in an early stage of the project so all 3 parties are on the same line and discussions 'half way' are avoided.

STEP 4. PROPOSAL:

Following the engineering phase all results and if needed special solutions are put together in a detailed proposal.

STEP 5. EXECUTION:

Execution means training of people on and around the line, monitoring the project during installation and commissioning and follow up afterwards to make sure the initial principles are preserved, the efficiencies reached and the savings made.

FAST, ACCURATE CHANGES!

SpeedSet™ bracket solves conveyor line change problems...quickly. The benefit of SpeedSet bracket is preset conveyor guide rail adjustability that is fast and accurate without the need for tools. SpeedSet bracket is fast because a simple push on the end knob moves the rod, clamp, and guide rail. Within seconds, each rail holding point can be adjusted, saving valuable time on line changes. SpeedSet bracket is accurate due to the innovative positioning spacer design. Customized to individual product requirements, positioning spacers accurately hold the rod and guide rail in position. Simply set the rails in "Home Position" for largest containers, and insert the positioning spacers for consistent spacing on smaller containers. Remove the blocks to return to the original "Home Position."

POSITIONING SPACERS

Used to hold the rod in an extended position, insert positioning spacer between the rod sleeve and the guide rail holder. These spacers can be fabricated to provide several positions within the Range of Travel.

PISTON ROD

Tapped piston rod can accept a wide variety of Valu Guide® rail holders (double rail clamp shown).

ROD SLEEVE

The rod sleeve provides the reach to the largest conveyed container while the rod inside the sleeve adjusts to the smaller container.

PUSH KNOB

The push knob is designed to have pressure applied to move the rod and guide rails into a new position.

SPRING

The spring maintains pressure which holds the positioning spacers and guide rail in place. When the positioning spacers are removed, the spring returns the guide rail to the "Home Position".

BRACKETS

Valu Guide® brackets are slotted to allow vertical height adjustment. The use of bracket spacers, swivel tops, and stacking rings allows virtually any conveyor line to take advantage of SpeedSet™ bracket.

HOME POSITION:

With the bracket nut loosened, the entire sleeve/rod assembly unit is located such that the rails are in the desired position for the largest container. Nut is then tightened, locking the entire assembly in place. Spring is not compressed and there is no spacer block in place.

ADJUSTMENT:

Pushing on the knob compresses the spring, moving guide rail toward the smaller container.

MODIFIED POSITION:

Positioning spacer is inserted and spring retracts rails into desired position.

Tethered Positioning Spacer shown.

CONVEYOR DESIGN FOR FLOWFLEX™ BELTS:

- Straight sections just require the standard conveyor design.
- The belt is sliding on the wearstrips just like a modular belt.
- In order to guide the belt, wearstrips with guide rail on top are recommended.
- For single track application the commonly used side-wearstrips are recommended.
- For curving sections first of all our magnetic corner tracks are recommended: they fit exactly the chain-belt and offer maximum chain retention.
- Connection between curve and straight sections also require just the standard design.
- Return part design also just requires the standard design.
- Drive and catenary design is exactly like with straight running ½ in belts.

2250 - FLIGHT VERSION

2250 FLAT TOP BELT WITH FLIGHTS

Our 2250 series modular plastic belts can be equipped with flights to convey products up an incline. Flights help to stop product from falling or sliding back. The flights can be integrated into flat top or flush grid belts and can be made in different FDA compliant materials and in different colors.

continue ▶

BELTS SPECIFICATIONS

- Pitch: 1" (25.4 mm)
- Thickness: 8.7 mm (0.34")
- Backflex radius: 25 mm (0.98")
- Max load capacity (@21°C): 25000 N/m (1700 lbs/ft.)
- Weight: Flush Grid version: 7.5 Kg/m² (1.53 lbs/ft².); Flat Top versions: 7.4 Kg/m² (1.51 lbs/ft².);
- Pin material: PBT
- Belt Material: NGE, LF or PP
- Open Surface-Only FG: 23%.
- Modular width system:
 - Metric: Standard widths can be made in 85-mm steps from 85 mm to 1870 mm. Special widths available upon request.
 - Standard packaging length:
 - width ≤ 340 mm (13.39"): 3,05 m (10 ft)
 - width > 340 mm (13.39") ≤ 1700 mm (66.93"): 1,52 m (5 ft)
 - width > 1700 mm (66.93"): upon request

FLIGHTS SPECIFICATION

All our flight modules are molded to guarantee a smooth and hygienic surface for easy cleaning. Standard available flights are shown below:

	TYPE 1	TYPE 2	TYPE 3
Height (F)	25.4 mm (1")	50.8 mm (2")	76.2 mm (3")
Width increments	Standard: 85 mm; Special: 17 mm		
Thickness (@ flight top)	2.5 mm		
Available Side Indent (S)	Standard: 51 mm (2"); Special: 17 mm (0.67") or 34 mm (1.34")		

The available standard flight height (F) are 2" or 1" and 3".

To facilitate a proper support of the belts in the return part of the conveyor, the belt can be made with side indents on the flights. The side indent (S) can be 17, (0.66") 34 (1.33 ") or 51 (2") mm with 51 mm (2") being the standard indent.

For wider belts (W > 600 mm), it is even possible to have 1, 2 or 3 notches in between the flights. In between the notch, a support is required to properly support the belt in the return and avoid it from bending.

Available Notch Width (C) is multiple of 17 mm (0.66"). Special width upon request

UPPER AND RETURN PART SUPPORT WITH FLAT OR C PROFILE

The C-profile may be necessary to retain the belt at the base of the incline. This will keep it from pulling up from the conveyor. Alternatively, a roller can be used at this location to cut down on sliding friction and wear. If a roller is used, ensure the roller size is greater than the belt's minimum backflex radius and also the roller is not touching the flights.

PRINCIPAL OF HANDLING FUNCTIONS

2253RTC - ROLLER TOP VERSION

continue ►

PRODUCTS THAT CAN BE HANDLED, GENERAL RECOMMENDATIONS:

To obtain a reliable movement, the contact surface should be relatively flat, and the weight should be uniformly spread.

Especially:

- The higher the number of spheres in contact with the product package the better is the support of the product package. The minimum number of spheres in contact, thus minimum possible footprint handled (contact surface belt/product), corresponds to 6 pcs (3x2), 6 in² about 38 cm². See below.

For 2253RTC belt. Go to product page:

3 0 3 9 8 a

2253RTC Construction detail. Go to:

7 2 2 9 0 a

2253RTC Calculation. Go to:

7 3 5 3 3 a

- Centre of gravity of the product should be as close to the centre of the product contact surface as possible.

Not recommended

Please contact our technical support to evaluate specific cases where it makes sense to test the handling on the roller top belt or just for assistance.

PRINCIPAL OF HANDLING FUNCTIONS

2253RTC - ROLLER TOP VERSION

ALL-PLASTIC CONSTRUCTION, ENERGY-EFFICIENT CONVEYANCE:

The freely rotating balls reduce rolling resistance, making energy-efficient conveyance possible.

◀ back continue ▶

1 INCH PITCH:

Offers maximum product support due to a comparatively high number of balls creating a high number of contact points between belt and product (1" pattern). That's important in terms of product stability. And to be able to handle more challenging forms and shapes.

Offers comparatively short transfers / dead plates between connecting conveyors due to small idler wheel / shaft diameters, particularly with middle drive conveyor design.

For 2253RTC belt.
Go to product page:

2253RTC Construction detail. Go to:

7 2 2 9 0 a

2253RTC Calculation. Go to:

7 3 5 3 3 a

BALL VERSUS ROLLERS:

Balls offer the highest grade of flexibility regarding conveying options and at the same time different product flow directions combined in only one conveyor. Balls offer the ultimate in flexibility which is a big advantage when it is required to change/add functionality.

EASY MAINTENANCE:

Roller top belt can easily be disassembled thanks to the patented, pin clip system. In case of damage, the part of the modular link that was damaged can be quickly replaced, making repairs fast and efficient. The ball elements are interchangeable.

WIDE CONVEYING SURFACE:

A wide, belt-like conveying surface with modular links assembled into a brick-layered arrangement similar to conventional modular belts offers maximum product support. The standard width system is in 3" increments.

PRINCIPLE OF HANDLING FUNCTIONS:

Conveyed goods make contact with plastic balls, which protrude from above and below modular links.

Auxiliary drive units control the rotation of the balls, enabling handling operations such as lateral transfer and rotation.

◀ back continue ▶

FRICTION PRODUCT/BELT:

In case of doubt about the handling of your pack on the roller top belt, we recommend conducting tests with your original product before finishing the design of your 2253RTC conveyor.

We have small test conveyors that could contribute in this testing process.

Please contact your local System Plast Application Engineering to discuss this.

For 2253RTC belt.
Go to product page:

3 0 3 9 8 a

OPERATING CONDITIONS:

Ball retainers are designed with internal ribs in order to offer low friction against the balls. A certain quantity of debris can be collected in the pockets between the ribs without affecting the rotation of the balls. If some balls do not rotate freely, conveyed goods may move uncontrolled and precise positioning can be more challenging. Blocked balls wear out unevenly and have to be replaced.

In case it cannot be avoided that dirt is accumulating on the belt, a proper cleaning regime needs to be put in place. Alternatively, a spare belt can be kept at hand to quickly swap and clean the polluted belt off line.

The system with auxiliary belt is based on constant and sufficient friction respectively grip. Any grip-reducing conditions, e.g. lubrication, water carry over, can affect the performance of the conveyor in an unpredictable way. For stable driving of the auxiliary belt, a proper and constant grip is important.

IMPORTANT: for a stable and smooth operations, it's important that the conveyors and thus the support of the roller top belt is flat and leveled, also in order to reduce the running noise.

The optimum functionality of the roller top belt is reached when the belt is clean. Carry over of dirt can reduce the functionality. Therefore, avoid that the belt gets polluted and thoroughly clean the belt if necessary.

Cleaning is necessary, if products do not move as they are supposed to do.

Intermediate cleaning can be done by means of compressed air blowing devices without dismantling the conveyor.

In case of pollution of the belt, we recommend to dismantle the belt completely for a proper cleaning.

◀ back continue ▶

DOUBLE (2X) SPEED PRINCIPLE:

When the belt is running at a certain speed V and the balls are in contact with the supporting surface, the pack will run at the double speed of the belt: $2xV$.

The fact that the pack speed is double the belt speed, means that often the roller top belt can run at lower speed. In this case the wear life of the belts is extended.

Using an auxiliary belt underneath the roller top belt, according to the sense of travel, it is also possible to realize metering effects. See examples in next chapters.

For 2253RTC belt. Go to product page:

3 0 3 9 8 a

2253RTC Construction detail. Go to:

7 2 2 9 0 a

2253RTC Calculation. Go to:

7 3 5 3 3 a

PRODUCT CAPABILITIES:

DIVERTER - LATERAL MOVEMENT

An auxiliary belt underneath the Roller top belt, running square to the travel direction, adds a lateral movement to the rollers. With that, the packs can be manipulated also in lateral direction. The system can transfer the pack with or without external guides. This scenario is ideal for reject conveyors or any application requiring rapid 90-degree transfer of the conveyed item. Pack positioning can also be achieved by this configuration.

Further details at page **7 3 5 3 3 a**

ROTATION WITH PRODUCT STOPPED

When using a rotating disc underneath the Roller top belt, you can have optimum control of the rotation of the pack. The Roller top belt must be stopped during rotation.

Further details at page **7 3 5 3 5 a**

ROTATION WITH PRODUCT MOVING

When two parallel auxiliary belts are positioned underneath the Roller top belts, and running in different directions and/or speeds, packs in the middle of the belt will rotate. This condition is ideal for applications where pack orientation is important, for example, the infeed to a palletizer. In this case, packs can be moved forward while rotating. This way of packs rotating 'on the move' gives a higher capacity.

Further details at page **7 3 5 3 7 a**

METERING

When the belt is moving and the rollers are in contact with a static support, the rollers will start rotating. This will result in movement of the product with a speed that is twice the speed of the belt. This function is very useful when products must be separated from each other. This function enables the belt to run at lower speed, which improves belt life and reduces energy consumption.

COMBINATIONS OF THE BASIC MOVEMENTS ARE POSSIBLE TO REALIZE THE REQUIRED CONFIGURATION.

CLEANING AND MAINTENANCE

GENERAL

Cleaning a conveyor is imperative to ensure proper performance for the duration of the conveyor life. Since pressure on production rates and production costs is increasing, companies often look at cleaning when trying to cut costs. Less time and resources are available, while at the same time the capacity of the lines (and thus pollution and product loss) may increase. When companies are setting up a cleaning regime they tend to focus on the individual machines (mainly filler and surrounding) and not so much on the conveyors. Therefore, we want to promote **CONVEYOR AWARENESS** with regards to a proper cleaning regime.

CLEANING INSTRUCTIONS

In many applications, a build-up of grease, dirt, debris or even spilled product like beer, soft drinks or juice can occur. This may cause problems with the conveyor operation. Therefore, a thorough and regular cleaning and rinsing procedure is very important to the successful operation of any conveyor line.

CLEANING IS NECESSARY TO:

- Minimize dirt and debris built up
- Keep bacterial growth under control
- Elongate service life of chains/belts
- Ensure smooth conveyance of chain/belt for optimum product stability
- Prevent crashes due to obstructions, such as broken glass
- Prevent malfunction due to sticky residues
- Keep friction low
- Avoid damage to the conveyed product
- Reduce power requirements
- Reduce or eliminate chain / modular belt pulsations
- Avoid excessive wear on chain / modular belt surface and in the joint hinge areas
- Avoid rapid wear on the wearstrips
- Reduce accelerated sprocket tooth wear
- Prevent chemical attack with proper rinsing procedures

If conveyors are going to sit idle for a long time before start-up, they should be covered with plastic to minimize dirt and debris that can settle into the chain / modular belt tracks. Also, do a proper total cleaning and wash down before you start running the conveyors.

CLEANING AND MAINTENANCE

◀ back continue ▶

FREQUENCY

AS A RULE OF THUMB WE SAY THAT CLEANING THE LINE ONCE A WEEK IS SUFFICIENT

LUBRICATED LINES:

Once a week.

In practice, depending on the circumstances, this can be more frequent (i.e. during product changes in case of product loss or other contamination) or less frequent in a relatively clean environment.

In the direct surrounding of the filler, cleaning will be more frequent. Depending also on the bacterial situation it may be necessary to clean at least once a day or once every shift. A thorough rinsing may also be sufficient as a "clean between cleanings."

Also, chemicals carrying over from a pasteurizer may require more frequent cleaning to prevent the chemicals attacks of chain/ belt materials.

In a can line where aluminum cans are filled, there's the aluminum oxide that must be kept under control.

This can occur also far away from filler-pasteurizer, where the line is running dry. In inliner, when the cans are accelerating the remaining drops will fall down with the aluminum oxide on the chain causing a highly abrasive sludge to build up. Therefore, it may be necessary to clean more frequently further down the line due to this phenomenon.

DRY RUNNING LINES "SMART CLEANING"

In applications that are completely dry running, less cleaning might be required. Dirt will not stick to dry chains and bacteria growth will be minimum. However, in such applications local cleaning can be necessary in case of unusual product spillage.

Daily:

- Remove broken glass which sticks between chains/belts and side guides.
- Clean the outfeed conveyors from the filler. Product spillage will cause extra wear especially after drying in. Ideally an automatic CIP cleaner can be installed.

Weekly:

- Wet areas, such as after the pasteurizer: due to chemicals coming from the pasteurizer this area needs extra attention to prevent chemicals from attacking the plastic chain/belt.

Monthly:

- All areas which are complete dry. Dry areas need less attention compared to wet or semi wet areas.

These are general recommendations to guide site cleaning procedures. The correct balance need to be found for each line.

Compared to a traditional water/soap lubricated line, a dry running line doesn't need more cleaning, but the cleaning interval will be different in some areas. Wet areas after the filler and pasteurizer need more attention compared to dry areas. In dry areas, no dirt or debris will build up.

It's important to keep the water and product spillage as close as possible to the process machines. A proper shower after the filler in combination with a blower to remove the water and product from the bottles is recommended. A strong blower after the pasteurizer to remove the water from the products will help to keep the subsequent conveyors dry.

◀ back

METHOD

Important for optimum service life of the chains and modular belts is a general inspection of the conveyors during operation. Listen for strange rattling or squeaking noises. Check transfer plates, return rollers, bearings, etc for proper product and chain/belt conveyance. Make sure the chain / modular belt is still running free without pinch points (extra resistance) or obstruction. Often the service life of a chain / modular belt is reduced for mechanical reasons that can be addressed easily.

When cleaning we advise to go through the following steps:

- Check for foreign parts on the conveyor and in the return
- Rinse with warm (max. 60° C / 140° F) or cold water thoroughly while chain / modular belt is running
- Use mild (pH: 5-9) detergent according to supplier's instruction
- If necessary, clean mechanically (soft brush) when pollution is hard to remove
- Rinse thoroughly with warm or cold water. Make sure all detergent is rinsed away while chain / modular belt is running
- Final a mechanical check that chain / modular belt is running free without obstruction

During this process, it's important not to forget to clean in between carry and return section and underneath the return support system.

NOTICE

Especially with plastic chains/modular belts the detergent in use needs to be checked for compatibility with the plastic material from the chain/modular belt. See at page **7 3 5 8 6 a**

ALWAYS thoroughly rinse all cleaning agents completely off the chain / modular belt and conveyor frame. Make sure that the underside of the chain / modular belt is also rinsed thoroughly.

DRY VERSUS WET

When a wet lubricant is in use (water and soap) product loss is normally flushed off by the water and soap. Often the soap also has a "cleaning function" built in.

But wet circumstances also attract dust and dirt and will increase the growth of bacteria.

When a line is standing still during a stop or during the weekend without cleaning, the lubricant will dry in which may cause pollution and changing sliding characteristics of the chains/belt after several times. It also may cause excessive resistance at start-up.

Under dry circumstances the conveyors generally remain cleaner. But product leakage needs to be rinsed away quickly to avoid functional problems of the line.

Therefore, functionally speaking wet lubrication is safer but requires a regular cleaning and has high cost factor.

All together with the present state of conveyor technology it is possible to run a major part of a glass, can or a PET line dry taken into consideration that a regular cleaning regime is in place.

2500RR CLEANING INSTRUCTIONS

RAISED RIB BELT 2500

CLEANING INSTRUCTIONS

GENERAL REMARKS

In pasteurizers, warmers and coolers there is a continuous water flow through the belt due to the process. This normally keeps the belt clean, provided there are additives in the water to prevent bacteria growth. Always check the chemical compatibility of these additives and other cleaning solutions with the belt material in advance. For material's chemical compatibility refer to page **7 3 5 8 6 a**

To enable a hygienic and trouble-free operation, we recommend checking the 2500 Raised Rib belt and all conveyor components regularly and to clean or replace them if necessary.

We recommend paying special attention to the following:

- Check the raised rib belt and the whole return part of the conveyor for foreign particles thoroughly and regularly. Check also both sides of the belt and the free space between belt side and the conveyor frame and the side guide. There might be foreign particles stuck in between the ribs, or any other free space, which can lead to bad product handling and damage of the belt, the finger-comb plates, the sprockets and other conveyor parts. This is especially critical for conveyors carrying glass bottles.
- Clean the area of the finger-comb plates regularly, to ensure that the finger-comb plates can move freely on their assembly plates. Dirt and debris should be removed immediately. Otherwise, the free movement of the finger plates is limited and thus the risk that fingers can bend or break will increase. It might be necessary to disassemble the shoulder screws and clean also the area of the slot holes. Replace any combs with broken fingers.
- During assembly ensure that there is no dirt and debris between the combs and their assembly plates.

Detailed information how to clean and maintain a pasteurizer-/ cooler-/ warmer tunnel, will be provided by the line manufacturer.

For temperature resistance of our products go to: **7 3 5 8 8 a**

Contact our technical support for further information.

7 3 0 2 3 a INSPECTION PROCEDURE AND REPLACEMENT CRITERIA

INSPECTION PROCEDURE AND REPLACEMENT CRITERIA:

During conveyor operation, periodic inspection of the chain/modular belt, sprocket and conveyor system is required to detect any issues and make repairs or replacement before serious damage may occurs. It is important to set up a regular inspection and maintenance schedule. The conveyors should be inspected while the system is running and when it is shut off.

The following to provide a general recommendation on conveyor components' inspection and its frequency.

	DAILY INSPECTION	WEEKLY INSPECTION	MONTHLY INSPECTION
1. Inspect chains for unusual wear patterns or damage	X	X	
2. Look for excessive gaps between chain flights - Check elongation periodically or if gaps appear to be excessive		X	
3. Check conveying surface for flatness, bent or broken flights	X		
4. Inspect hold-down tabs or beveled sliding surfaces for excessive wear			X
5. Review chain catenary sag for proper amount—remove links if sag exceeds 6" from bottom of drive sprocket			X
6. If take-ups are used, check that take-up tension is not excessive. Do not preload chain			X
7. Check all idlers, rollers, turn discs and sprockets for free rotation			X
8. Examine sprockets for excessive wear			X
9. Look for debris build up in sprocket tooth pockets			X
10. Check for excessive sprocket guide ring wear			X
11. Check all wearstrips and fasteners for excessive or unusual wear			X
12. Check all transfer points, dead plates, turn tables, turn discs and sprockets for proper elevation and alignment			X
13. Review function of lubrication system			X
14. Inspect general cleanliness of conveyor system		X

7 3 0 2 4 a INSPECTION PROCEDURE AND REPLACEMENT CRITERIA

◀ back continue ▶

The below inspection methods provide measurement criteria for functional characteristics (i.e. chain pitch) of conveyor components. If the recorded value during inspection exceeds the maximum allowable value, the conveyor component should be replaced. Refer to replacement criteria for requirements.

A - CHAIN/BELT INSPECTION METHOD

A1- CHAIN/BELT PITCH

Inspection device:

- Tape measure

Inspection method:

- Make sure that the chain/belt is under light tension and straight
- Measure the length of 10 chain links/belt modules. Make sure you take the same reference edge at the links
- Divide measured link/module values by 10 to have the average. Record this value
- Subtract original chain pitch from measured chain pitch
- Divide difference by original chain pitch to get percent elongation

Example:

10 pitches of 828 measured 393.7 mm (15.5"); $393.7/10 = 39.37$ mm (1.55") pitch.

828 has a 38.1 mm (1.5") pitch, so $(39.37-38.1)/38.1 * 100\% = 3.33\%$

A2- REPLACEMENT CRITERIA:

- All belts and chains should be replaced when percent elongation exceeds 3%
- The chain or belt is jumping the sprocket. This typically begins at around 3% of elongation
- The hinge is worn to an extent that the pins are visible
- Conveyor is surging due to elongation, which is causing product handling issues

A3- CHAIN/BELT THICKNESS

Inspection device:

- Calliper gauge

Inspection method:

- Clean the links to be measured
- Measure 5 links
- Eliminate the smallest and the largest value
- Calculate the average out of the three remaining readings. Record this value

A4- REPLACEMENT CRITERIA

- Chains should be replaced when the flight thickness has been reduced by 50% of the original value
- Belts should be replaced when the module thickness has been reduced by 2 mm (0.08")
- The surface becomes uneven or scratched causing product stability problems
- Product handling issues are occurring

7 3 0 2 5 a INSPECTION PROCEDURE AND REPLACEMENT CRITERIA

B - SPROCKET INSPECTION METHOD

B1- SPROCKET TEETH

Inspection method:

A visual check for:

- A proper engagement with chain/belt
- Worn teeth
- Embedded dirt, glass particles that cannot be removed

◀ back continue ▶

B2- REPLACEMENT CRITERIA:

- Sprocket teeth are worn, damaged, or have a hooked profile
- Chain is no longer engaging sprocket properly
- Chain/belt does not release well

B3- SPROCKET BORE AND KEYWAY

Check bore play against shaft: Feel the play just by moving the sprocket by hand. If the play is too big or the sprocket swivel angle is too much, double-check the play with a feeler gauge. Visual check of keyway for any damage.

Inspection device:

- Feeler gauge

Inspection method:

- Measure the play with the feeler gauge
- Calculate the average measured values. Record this value

B4- REPLACEMENT CRITERIA

- Sprocket is loose on drive shaft
- Bore of sprocket is worn out and sprocket starts to oscillate. Bore lays against shaft is over the limit value of 1 mm.
- Hub or keyway is damaged
- New chain/belt is installed

7 3 0 2 6 a INSPECTION PROCEDURE AND REPLACEMENT CRITERIA

C - IDLER WHEEL INSPECTION METHOD

C1- IDLER EDGE

Inspection method:

A visual check for:

- proper engagement with chain/belt plates
- proper engagement with chain hinges/belt positioners
- uneven wear surfaces (indicates the wheel is not turning)

◀ back continue ▶

C2- IDLER BORE:

Check bore play against shaft: Feel the play just by moving the idler by hand. If the play is too big or the idler swivel angle is too much, double-check the play with a feeler gauge. Visual check for any other damage.

Inspection device:

- Feeler gauge.

Inspection method:

- Measure the play with the feeler gauge.
- Calculate the average measured values. Record this value.

C3- REPLACEMENT CRITERIA

- Idler edges are worn or damaged
- Idler is loose on drive shaft
- Bore of idler is worn out and idler starts to oscillate. Bore lays against shaft is over the limit value of 1.5 mm

D - WEARSTRIP INSPECTION METHOD

D1- WEARSTRIP THICKNESS

Inspection device:

- Caliper gauge

Inspection method:

- Measure the thickness at the actual sliding surface of the wearstrip
- Calculate the average measured values. Record this value

D2- REPLACEMENT CRITERIA

- Thickness is reduced by 50% and stability problems occur
- Dirt or debris is embedded
- Fixing bolts protrude
- Plastic has become brittle

7 3 0 2 7 a INSPECTION PROCEDURE AND REPLACEMENT CRITERIA

◀ back

E - CURVE INSPECTION METHOD

E1- MAGNETIC CURVE TRACK WIDTH

Inspection device:

- Caliper gauge

Inspection method:

- Clean the curve track
- Measure the width at the indicated point in figure (3 measurements at each point)
- Calculate the average measured values.
Record this value

E2- REPLACEMENT CRITERIA

- Chain is hanging over inside edge of curve (image 1)
- Tab, bevel or magnet is no longer securing chain in track
- Throat clearance has increased by 3/16" beyond design recommendations

Normal situation:
chain centered on the curve

Worn curve:
chain over the inside edge

IMAGE 1

RECOMMENDATION

Record the average of measured values together with:

- Conveyor identification number (drive number)
- Date of the measurement
- Name of the person who measured
- Performed service hours of the chain/belt
- Performed service hours of the line

7 3 0 3 0 a MOUNTING AND REMOVAL OF BELTS

GENERAL

We advise making a section of the guides easily removable to allow access to remove belt for inspection, maintenance or any other purpose. Alternatively, make a position on the conveyor where the belt can be easily removed.

For all belting, the set of tools shown below are required: a flat screwdriver (1) and a pin puncher (2) or gimlet (3).

1- FLAT SCREWDRIVER

The flat screwdriver size required can change based on the hinge diameter of the belt. For instance, the screwdriver needed to break a 2" pitch belt is wider than the one needed for breaking a ½" pitch belt due to the difference the hinge diameter.

For belt with slider shoe, a cross screwdriver is required.

2- PUNCH

A punch can be used to push the pin through the belt for easy removal. Alternatively, another pin can be used to push the pin through the belt.

3- GIMLET

We also recommend a self-tapping screw or a gimlet to catch the hole in the center of the pin. This will allow you to pull the pin free of the belt if you only have access from one side.

Note:

1. For the belt removal and mounting instructions pictures, we have considered only one belt series. The procedure is applicable for all versions of the same series. For instance, in the first example we have considered a 2120 flush grid belt, and though these instructions are applicable also for the flat top version of the same series 2120.
2. Depending on the belt length and width (so the overall belt weight), more than one operator may be needed to assemble and disassemble the belt.

SIDEFLEXING BELTS

MOUNTING AND REMOVAL

We advise to make part of the guides easy to remove to be able to take the belt out easily for inspection, maintenance or any other purpose or to make a position on the conveyor where the Powerflex™ belt can be easily removed.

Keep enough room in TAB track to be able to move the belt to the outside and lift the TAB out of the track. See below:

2351-2451
2551-2651.
Go to product page:
3 0 7 4 5 a

The patented clip system allows for very easy mounting and dismounting of the pins and modules. With a sufficiently large flat screw driver, the pin clip can be twisted and removed. See below:

7 3 0 4 5 a **INSTALLATION PROCEDURE**

1. Check all sprockets, idlers, turn discs and rollers for proper elevation and alignment
 - a. Ensure sprocket and chain series are compatible
 - b. Check shaft drop for proper height adjustment (see section **7 2 1 3 0 a**)
 - c. Ensure sprocket is properly aligned in chain/belt sprocket pocket
 - d. Wider belts, ensure all but one or two drive sprockets are allowed to float to accommodate belt expansion. Center sprockets should be locked down.**
2. Use a small section of chain to run through conveyor frame to look for catch points
 - a. Check all wear strips (carry and return), dead plates, mounting hardware dividers and transfers mechanism for proper location, elevation, spacing and flatness
 - I. Adjust or chamfer any transitions where the section does not pass through smoothly
 - II. This will also help to find any obstructions
3. Check all fasteners for proper tightness (torque). Fasteners used on wear strips and dead plates must have recessed heads
 - a. Use lock washers where appropriate to prevent hardware from coming loose
4. Check all conveyor splice points for proper elevation, alignment and fastening
 - a. Use lock washers where appropriate to prevent hardware from coming loose
5. Check lubrication system (if present)
6. Install conveyor chain, assuring that the following has been done:
 - a. Check for correct direction of chain travel
 - I. Outer eyes forward or "tail in the back" on Table Top chain
 - II. Modular belts are often bidirectional, but refer to catalog for preferred direction of travel
 - b. Assemble chain in 10 ft (3,05 m) sections and avoid twisting or damaging the chain
 - I. Do not drag uncoiled chain across floor - this will pick up debris, reducing overall conveyor life
 - II. Be careful not to over-backflex the chains or belts during installation
 - c. Connect chain sections on the conveyor. Make sure that the connecting pins are not protruding, and clips are properly inserted
 - d. Adjust chain catenary (sag) to the proper elevation. Note: readjustment is usually necessary after a certain operating time.
 - I. General rule of thumb: tension chain or belt as tightly as you can by hand - do not use additional mechanical forces to tension
7. If using lubrication, ensure that lubricant is evenly dispersed through conveyor system
8. Start conveyor by jogging and/or using short running periods before loading the system. Be alert to unusual noises or actions such as jumping, "ticking" or shifting. If a problem should occur, refer to the troubleshooting guide
9. Check the catenary sag (refer to section **7 2 1 4 0 b**)
 - a. Catenary should be adjusted ~ 2-weeks after installation as the chain breaks in from operation
 - b. System Plast chains / modular belts should never be run under excessive tension
 - c. The catenary sag should be measured when running with product
 - d. If the catenary sag is excessive or increases due to normal wear, it should be adjusted regularly by removing links to obtain the proper sag

STANDARD CURVE SYSTEMS

Curves are generally mounted between stainless steel frames and fastened with screws. Alternatively, bolts may be used if optional threaded inserts are specified for the curves.

For curves wider than 3 tracks we recommend to using cross bar supports to prevent the curve from deflecting under load.

For trouble-free infeed of the chains into the return, Return Guide Shoes mounted at the infeed of the return part of the curve are recommended

In case of staggered return, position return guide shoe level to top track:

INSTALLATION OF CURVES

TOPTRAC® CONVEYOR MAGNETIC CURVES INSTALLATION INSTRUCTIONS

◀ back continue ▶

⚠ WARNING

- Read and follow all instructions carefully.
- Do not operate equipment without guards in place. Exposed equipment can result in severe injury or death.

⚠ CAUTION

- Periodic inspections should be performed. Failure to perform proper maintenance can result in premature product failure and personal injury.

**Option 1:
Standard fixation: top to return**

Option 1A: top packed with return

Option 1B: conveyor beam between top and return

1. Detach top from bottom
2. With the return upside down, mark and drill the holes in the conveyor beam ③

3. Hang the return to the conveyor beam through an "M-bolt" (not included)

4. Align top with return and fix them together by the self tapping screws ④

- ① Curve/Plastic
- ② Conveyor frame
- ③ Conveyor beam
- ④ ø 4,3 mm countersunk self tapping screws

**Note: In all possible fixation styles, the angle for each hole can be freely chosen at your convenience.

BEARINGS MOUNTING INSTRUCTIONS

LOCKING WITH GRUB SCREW AND ECCENTRIC RING

continue ►

Bearing selection.
Go to:
7 3 5 4 2 a

NOTES:

1. Additional bearing installation, relubrication and maintenance instructions can be found on our website: <https://www.regalpts.com/resources/literature>
2. The bearing is pre-lubricated with an H1 grade, synthetic base oil, complex calcium sulfonate soap thickener NLGI 2 grease. Re-greasing is not required during installation. When re-greasing, we recommend re-greasing with a compatible grease. When feasible the bearing should be rotated while re-greasing for a better distribution of the grease.
3. Bearing assemblies are supplied with a lubrication fitting installed in the housing and may contain a plug supplied loose in the bag or box. If you want to make the bearing assembly non-re-greaseable, remove the lubrication fitting and install the plug. In general, re-greasing will help promote operating bearing life. For more details refer to Lubrication chapter at **7 3 0 5 4 a**

INSTALLATION STEPS

STEP 1: INSPECT SHAFT AND BORE

Shaft should be within tolerance range shown in Table 1, clean and free of nicks and burrs.

1. Mount bearing on unused section of shafting or repair/ replace shafting as required.
2. Inspect both the shaft and bearing bore for debris or contaminants. Wipe clean as necessary.

TABLE 1

SHAFT DIAMETER	SHAFT TOLERANCE
1/2" to 1 1/2"	Nominal to -.0005"
12mm to 40mm	Nominal to -.013mm

STEP 2: CHECK SUPPORT SURFACES

Make sure the base of the housing and the support surfaces are clean and free from burrs.

If the housing elevation is adjusted with shims these must cover the entire contact area between the housing and the support surface.

STEP 3: INSTALL UNIT

To aid installation, keep weight off bearing during mounting. Slide unit onto shaft by pushing on the inner ring.

If it is difficult to mount bearing on shaft, use a piece of emery cloth to reduce high spots on shaft.

STEP 4: FASTEN UNIT IN PLACE

Install housing mounting bolts and check bearing alignment. Align the bearing units as closely as possible. Tighten mounting bolts to recommended fastener torques. Check the shaft for freedom of rotation by rotating shaft with hand in both directions.

STEP 5: TIGHTEN LOCKING MECHANISM. 7 3 0 5 3 a

INSTALLATION STEPS

STEP 5: TIGHTEN LOCKING MECHANISM

a. Setscrew (Grub screw) Locking Inserts

Setscrews (Grub screws) in multiple bearing applications should be aligned as shown.

Bearing selection.

Go to:

7 3 5 4 2 a

Tighten bearing units to the shaft as follows:

1. Torque first setscrew (grub screw) "A" to one half the recommended torque in table 2 or 3.
2. Torque the second setscrew (grub screw) "B" to the full recommend torque in table 2 or 3. Go back to "A" and tighten to full recommend torque.

TABLE 2A AND 2B / AISI 52100 CHROME STEEL SETSCREW (GRUB SCREW) LOCKING

BORE DIAMETER	SETSCREW (GRUB SCREW)	RECOMMENDED TORQUE	
		Nm	in-lbs
12, 15, 16, 17	M5x0.8	3.4	30

1 1/4, 1 7/16, 1 1/2	5/16"-24	11.3	100

B. ECCENTRIC LOCKING INSERTS

1. Place collar on inner race and rotate by hand in direction of shaft rotation until eccentrics are engaged.
2. Use Spanner Wrench (as shown) or insert drift pin into the hole in the collar O.D. "B" and lock in direction of shaft rotation with the aid of small hammer.
3. Toque single setscrew (grub screw) "A" to recommended torque in Table 4.

Check shaft again for freedom of rotation and then tighten the second bearing unit in the same fashion. When all bearings are tightened, perform a final check to the shaft for freedom of rotation.

TABLE 4A AND 4B / AISI 52100 CHROME STEEL ECCENTRIC LOCKING

PLAIN SHAFT

SUPPORTS FOR SHAFTS WITH CONSTANT DIAMETER (PLAIN) HAVE MAIN CHARACTERISTICS:

- Compensation for mistakes in alignment.
- Adaptability to shaft deflections.
- Resistance against chemical agents.
- Support of radial loads.
- Support of light axial loads.
- High load capacity.

◀ back continue ▶

Bearing selection.
Go to:

7 3 5 4 2 a

LUBRICATION AND MAINTENANCE

Bearing assemblies are supplied with a lubrication fitting installed in the housing and may contain a plug supplied loose in the bag or box. If you want to make the bearing assembly non-greaseable, remove the lubrication fitting and install the plug. In general, re-greasing will help promote operating bearing life.

SUPPORT TYPE	GREASE-NIPPLE TYPE
CL..	M6
CS..	M6
SQL..	M6
UCF..	1/8" GAS
UCFB..	M6
UCFG..	M6
UCFH..	M6
UCFL..	1/8" GAS
UCFO..	M6
UCHE..	M6
UCP..	M6
UCPA..	M6
UCT..	M6
UCTT..	M6

TYPE OF LUBRICANT

The bearing is pre-lubricated with an H1 grade, synthetic base oil, complex calcium sulfonate soap thickener NLGI 2 grease. Re-greasing is not required during installation. When re-greasing, we recommend re-greasing with a compatible grease.

PRE-LUBRICATION

Lips of seals must be lubricated during assembly to avoid damage during the first revolutions of the shaft.

RE-LUBRICATION

Bearing supports must be lubricated while moving, so that grease can cover the whole surface of balls. Grease must be introduced slowly, often and in small quantities.

Pressure of the grease gun should be between 1.3 and 2.0 bar, otherwise you risk blowing out the seals with re-greasing.

LUBRICATION INTERVAL

Lubrication periods depend on use conditions of bearing supports. Dust, humidity, load, temperature significantly affect the interval of time between relubrication.

The table shows indicative values for relubrication periods.

USE CONDITIONS	TEMPERATURE		RE-LUBRICATION PERIOD (MONTHS)
	°C	°F	
clean	up to 50	up to 120	6 - 12
clean	50 - 70	120 - 160	4 - 8

7 3 0 5 8 a HOW TO IDENTIFY A CURVE

When a curve is to be replaced with a new one and its code or description are not available we can proceed to its identification in two ways.

Identify a curve from following information:

A:

- which type of chain and what width, i.e. 880M-K325
- angle α ; centre radius R; Infeed/Outfeed lengths L_{in}/L_{out} if any
- total width TL and pitch P in case of multiple strand
- type of return
- inserts; mounting hole, etc

See drawing:

B:

- Which type of chain and what width, i.e. 880M-K325
- Inside length curve ILC and Outside length curve OLC
- Total width TL and pitch P in case of multiple strand
- Infeed (L_{in}) and Outfeed (L_{out}) Tangents if any
- Distance to centerline for first track $L/2$
- Type of return
- Inserts; mounting hole, etc

See drawing:

The curve lengths (OLC and ILC) can be measured with a rope. Afterwards the rope length can be measured with a tape measure

In both case:

1. Check the thickness T of the upper part and for multiple strands measure the pitch P between the individual strands:

2. For the return section measure the thickness H and check whether the tracks are staggered:

For special mounting holes or threaded inserts please provide a detailed drawing of the type and position.

7 3 0 6 2 a TROUBLESHOOTING

CHAIN/BELT JUMPS ON SPROCKET

POSSIBLE CAUSES	REMEDY
Chain/belt is elongated, possibly due to wear or overloading	Replace chain/belt and sprocket Check other components as well Eliminate cause of overload
Improper catenary sag	Check dimensions and adjust
Sprocket is worn	Replace sprocket and inspect chain/belt for damage
Wrong sprocket type or mismatched sprocket halves	Install correct sprocket and ensure a matched set
Misaligned sprocket	Check and adjust
Improper sprocket position	Check and adjust position

CHAIN/BELT DOES NOT RELEASE WELL

POSSIBLE CAUSES	REMEDY
Incorrect sprocket dimension or type	Check and replace sprocket
Sticky residue	Clean chain/sprocket or renew
Improper catenary sag or excessive wrap (snub roller)	Remove unnecessary snub and check
Elongation - Pitch of chain/belt no longer matches pitch of sprocket	Check chain/belt elongation Replace chain/belt and sprocket if elongation is beyond 3%

SLIP STICK OPERATION (SURGING)

POSSIBLE CAUSES	REMEDY
Tacky / sticky wear surface	Use lubrication and/or increase cleaning regime Reduce chain/belt tension by shortening the conveyor
Return roller diameter too small or improperly spaced	Install larger rollers or increase number of rollers
Chain/belt catches the conveyor or return rollers	Remove obstructions and ensure return rollers are turning freely
Improper catenary sag	Check dimension and adjust
Lubrication may cause vacuum suction	Change wearbed to allow lubrication pass-through

DAMAGED CHAIN HINGES

POSSIBLE CAUSES	REMEDY
Overloading Chain jumping on sprocket teeth or other impact forces	Eliminate cause of overloading Check sprockets and other components Replace chain/belt
Blocking and obstructions	Check the complete conveyor
Exceeding the minimum backflex radius	Check conveyor construction
Radius is too small for side-flexing chain	Check minimum radius of chain and adjust accordingly

Please contact technical support at any time if you have any questions.

TROUBLESHOOTING

◀ back continue ▶

ELONGATION

POSSIBLE CAUSES	REMEDY
Overloading / excessive chain pull Chain/belt is over-tensioned with spring, screw or pneumatic tensioner	Eliminate cause of overload and minimize tensioning force Check sprockets and other components Replace chain/belt Replace components if necessary
Wear from dirt in hinges causing abrasive wear	Improve cleaning Use HB pins Consider more wear-resistant material

RAPID CURVE WEAR

POSSIBLE CAUSES	REMEDY
Overheating / PV Failure	Use EXTRA curve or Nolu®-S parts Do chain pull calculation to confirm application Check conveyor for catch points which may be increasing chain tension
Embedded abrasives	Replace curve and assess cleaning procedure

CHAIN DRIFTS SIDWAYS ON SPROCKETS

POSSIBLE CAUSES	REMEDY
Bad shaft/sprocket alignment	Adjust or use collars to allow sprocket play
Conveyors is not level	Adjust as necessary
Insufficient tangent between last curve and drive sprocket	Increase drive length - at least 2-ft recommended at drive
Chain is not properly retained on conveyor	Check wearbed - positioning tabs? Lip on wearstrip belt
Shafts are not square to one another	Check diagonals for square - adjust as necessary

CRACKED HINGE EYES

POSSIBLE CAUSES	REMEDY
Stress-corrosion caused by incompatible chemicals	Check chemicals compatibility with chain/belt material Use appropriate chemicals and / or reevaluate rinsing procedure
Over-backflexing	Check return and catenary to ensure proper setup

Please contact technical support at any time if you have any questions.

◀ back continue ▶

CHAINS FOR MAGNETIC SYSTEM PULL UP FROM CURVE

POSSIBLE CAUSES	REMEDY
Worn curve	Replace curve
Improper chamfering of the infeed or other obstructions	Check and adjust/rework
No soft start-up	Install frequency inverter drives
Curve not mounted level	Check and adjust

CORRODED STEEL CHAIN

POSSIBLE CAUSES	REMEDY
Incompatible combination of chain material and chemicals	Use only compatible chemicals
May occur even with stainless steel	Consider higher graded material

EXCESSIVE CHAIN/BELT WEAR

POSSIBLE CAUSES	REMEDY
Contamination / Debris in return	Improve cleaning and evaluate cleaning regime
Failing lubrication	Check lubrication system Contact lubricant supplier
Obstructions	Check all sections
Return rollers are smaller than minimum backflex radius	Install roller with larger diameter or consider serpentine returns

SPROCKETS DO NOT SLIDE ON SHAFT WHEN BELT EXPANDS/CONTRACTS DUE TO TEMPERATURE CHANGES

POSSIBLE CAUSES	REMEDY
Contamination	Improve cleaning
Sprockets are locked to the shaft improperly	Re-adjust axial fixing according to temperature situation
Wrong bore tolerance	Replace with sprockets with PLUS tolerance Use square shafts or double-keyed shafts in extreme situations

RAPID WEAR ON SPROCKETS

POSSIBLE CAUSES	REMEDY
Abrasive conditions	Improve cleaning to remove debris (check drive pockets) Use more wear resistant sprockets, if available
Excessive tensioning or load	Reduce tensioners, if present Verify chain pull calculation

Please contact technical support at any time if you have any questions.

7 3 0 6 5 a TROUBLESHOOTING

ABNORMAL NOISE, SQUEAKING, RATTLING

POSSIBLE CAUSES	REMEDY
Chain is touching safety cover, frame, or conveyor parts etc	Locate the source and adjust to free the chain Remove any obstructions
Wearstrip and/or Wearstrip guide clearance is improperly adjusted	Locate the tight part and adjust the clearance
Wearstrip surface finish is rough or dimensions and/or materials are not appropriate	Replace with wearstrips with the appropriate material and profile
Lubrication is insufficient or operating conditions are too extreme	Lubricant and/or lubrication regime should be reevaluated
Chain is not properly supported in the return	Relocate to on top of the roller or repair serpentine if necessary

PULSATION

POSSIBLE CAUSES	REMEDY
The location/spacing of return rollers Size / position of the catenary are not appropriate.	Adjust according to page 7 2 1 4 4 a Return Part construction
Idle sprocket and/or return roller not rotating smoothly	Adjust by using bearings so that they rotate more smoothly or increase their diameter
Foreign particles adhering to the wearstrip impede smooth sliding	Clean wearstrips
Lubrication is insufficient or operating conditions are too extreme	Lubricant and/or lubrication regime should be changed
Chain is running where guide clearance with the wearstrip is tight	Locate the tight part and adjust the clearance
Unfavorable speed to length ratio	Use Nolu®-S parts Adjust drive location if possible
Long conveyor with return rollers positioned at consistent intervals	Return roller distance should be staggered for high speed and long conveyor like 600 mm (24-in), then 400 mm (16-in) and so on. This help to avoid chain/belt pulsation

Please contact technical support at any time if you have any questions.

CHAIN/BELT PULL CALCULATION FOR GENERAL PURPOSE CONVEYOR

The pull required to convey the products can be calculated for several conveyor types as follow:

A- STRAIGHT FLAT CONVEYOR WITHOUT ACCUMULATION

The total pull at drive end is the sum of return part pull and carry part pull. See below scheme for involved forces representations at conveyor carry and return parts.

- L:** Length of the conveyor shaft to shaft (m or ft);
- b:** Product pitch, not required when product weight per unit length is noted;
- P:** Product weight per unit length (N/m or lbf/ft);
- W:** belt/chain weight per unit length (N/m or lbf/ft);
- g:** gravity (m/s² or ft/s²);

The mass of chain per unit length is provided for each chain on SmartGuide® catalog;
For belt the mass per unit square is available on SmartGuide® catalog; the mass per unit length is done by multiplying the mass per unit square by the width of the belt in [m] or [ft].

CARRY PART:

The carry part pull Tc is the sum of **f₁** and **f₂**:

(1) $T_c = (f_1 + f_2)$ [N or lbf]

- f₁** : friction force between belt/chain and wear strips due to the product weight
- f₂** : friction force between belt/chain and wear strips due to belt/chain weight

(2) $f_1 = \mu_{cp} * P * L$

μ_{cp} : coefficient of dynamic friction between product and belt/chain due to product

(3) $f_2 = \mu_{cw} * W * L$

μ_{cw} : coefficient of dynamic friction between belt/chain and wear strip due to belt/chain

Equation (1) becomes:

(4) $T_c = (M * \mu_{cp} + M_c * \mu_{cw}) * g * L$ [N or lbf]

M_c: Mass of chain/belt per unit length [kg/m or lb/ft]

M: Mass of the product per unit length [kg/m or lb/ft]

NOTE: In normal condition we assume the product for not slide over the chain/belt so **μ_{cp} = μ_{cw}**.

For other conditions where product slides over the chain/belt as accumulation **μ_{cp} ≠ μ_{cw}**.

Modular belts & sprockets	Chain & belt return systems	Frame & structure supports	Bearing supports	
Curves & tracks	Side guide solutions	Miscellaneous products	Equipment	

RETURN PART

In the return part there is no product carried, thus the mass of the product per unit length **M=0**.

The return part pull **T_R** is then:

$$(5) T_R = g * L * M_c * \mu_{cr} \text{ [N or lbf]}$$

μ_{cr}: coefficient of dynamic friction between belt/chain and guide in the return part.

The total pull T of the flat conveyor (excluded the pull due to chordal effect) is done by:

$$(6) T = T_C + T_R = g * L * (M * \mu_{cp} + M_c (\mu_{cw} + \mu_{cr})) \text{ [N or lbf]}$$

The coefficient of friction can be monitored with the iCOF® device. For more details refer to **5 7 0 8 0 a**

B- STRAIGHT FLAT CONVEYOR WITH ACCUMULATION:

In case of accumulation of the product, the pull will be as in formula (6) added the contribution of accumulation section.

Considering:

L_a: length of the accumulation section [m or ft];

M_a: mass per unit length of accumulated products [kg/m or lb/ft];

μ_{cp} friction coefficient between belt/chain and accumulated products;

The COFs between chain/belt and wearstrips and between chain/belt and products are available at page **7 3 5 7 8 a**

The Total pull will be:

$$(6a) T = T_C + T_R + T_a = [g * (L - L_a) * (M * \mu_{cp} + M_c * \mu_{cw})] + [g * L * M_c * \mu_{CR}] + [M_a * \mu_{cp} * g * L_a]$$

Chains & sprockets	Wear strips	Side guide brackets & accessories	Levelers	Engineering manual

Curves & tracks	Side guide solutions	Miscellaneous products	Equipment	

◀ back

B- STRAIGHT INCLINED CONVEYOR

As the only difference between an inclined and a flat conveyor is the angle of inclination α , we will skip most calculation steps to get in the final formula.

In below inclined conveyor schematic, all significant forces of the conveyor are considered

α = incline angle (°);

CARRY PART

The carry part pull T_c is the sum of all horizontal forces;

$$(7) T_c = (f_1 + P_{II} + f_2 + W_{II})$$

where

$$(8) f_1 = \mu_{cp} * P_L * L = \mu_{cp} * P * L * \cos \alpha$$

$$(9) f_2 = \mu_{cw} * W_L * L = \mu_{cw} * W * L * \cos \alpha$$

$$(10) P_{II} = P * L * \sin \alpha = M * g * L * \sin \alpha$$

$$(11) W_{II} = W * L * \sin \alpha = M_c * g * L * \sin \alpha$$

RETURN PART

In the return part there is no product carried, thus $M=0$.

$$(12) T_r = M_c * g * L * (\mu_{cr} * \cos \alpha + \sin \alpha)$$

The total pull T of the inclined/declined conveyor (excluded the pull due to chordal effect) is done by:

$$(13) T = T_c + T_r = g * L * [M * (\mu_{cp} * \cos \alpha + \sin \alpha) + M_c * (\mu_{cw} * \cos \alpha + \sin \alpha)] + g * L * M_c * (\mu_{cr} * \cos \alpha + \sin \alpha)$$

C- NET SHAFT POWER NP

$$(14) NP = T * v$$

V is the conveyor speed [m/s or ft/s]

T the pull [kN or lbf]

NP [kW or lbf*ft/s]

Above calculation is the basic, for detailed calculation use our calculation program SPEC® (<http://spec.systemplast.com>)

GENERAL CALCULATION**

MAXIMUM ACCELERATION:

The maximum acceleration force F_{max} on a product to be able to convey the product with the chain depends on the friction between product and chain.

Maximum acceleration a_{max} can be calculated with:

$$a_{max} = \frac{F_{max}}{M} = \frac{W * \mu}{M} = \frac{M * g * \mu}{M} = g * \mu$$

W = weight of product in [N] or [Lb_f]

M = weight of product in [kg] or [lb_m]

μ = coefficient of friction between chain/belt and product

g = gravitational acceleration = 9.81 m/s² (32.2 ft/s²)

MAXIMUM FORCE ON PRODUCTS TO AVOID TIPPAGE:

The maximum acceleration a_{CG} without products falling over is dependent on the shape (position of the center of gravity), the weight, and the product material. This is for instance, it is also important when the product is being conveyed onto a dead plate.

When a bottle is moving on conveyors, there are external forces acting on it:

$$F^{ext} = M * a_{CG} = \mu * M * g$$

Figure 1

The force F^{ext} is the force due to acceleration or deceleration of the product or due to a different cause like other bottles or a side guide.

**PRODUCT HANDLING
GENERAL CALCULATION**

◀ back

BOTTLE EQUILIBRIUM:

The equilibrium condition of a bottle is that the vector of the vertical component of resultant forces passing by its gravity center falls inside support base (blue circle) i.e. $\alpha > \beta$. See figure 1.

Angle α is determined by the diameter of the footprint of the product ($B = \frac{1}{2} * \text{bottle diameter}$) and the height of the centre point of gravity (A).

Angle β is determined by the horizontal force on the bottle (F^{ext}) relative to the weight of the bottle (P).

Bottle falls when $\beta > \alpha$. That means in:

$$\frac{F^{ext}}{P} > \frac{B}{A} ; \frac{m \cdot g \cdot \mu}{m \cdot g} > \frac{B}{A} \rightarrow \mu > \frac{B}{A}$$

In conclusion:

when $\mu > \frac{B}{A}$ containers fall; and when $\mu < \frac{B}{A}$ containers remain standing

CENTRIFUGAL FORCES:

When a product is being conveyed through a curve there's a centrifugal force working on the product. This force on the product is compensated by the friction between chain and product and by a side guide.

The centrifugal force is calculated with:

$$F_c = \frac{M \cdot v^2}{r}$$

M = weight of the product

v = speed

r = center radius of the curve

Friction force between chain and product is calculated with:

$$F_m = M \cdot g \cdot \mu$$

g = gravitational acceleration

μ = coefficient of friction between belt/chain and product

The minimum force **F** that needs to be generated by the side guide is:

$$F = F_c - F_m = M \cdot \left[\frac{v^2}{r} - g \cdot \mu \right]$$

PRESSURE OF ACCUMULATION PRODUCTS

GENERAL CALCULATION

PRESSURE OF ACCUMULATING PRODUCTS OR BACKLINE PRESSURE:

When a product is standing still (e.g. against a stopper or guide), the chain running underneath the product creates a force on the product equal to the weight of the product multiplied by the coefficient of friction between chain and product.

Each following product is pushing with the same force against the next product, so the resulting force is proportional to the total weight of products upstream. This force is the same as the accumulation contribute on formula 6A.

$$F_a = W_a * L_a * \mu$$

$$F_a = M_a * g * \mu_{cp} * L_a$$

- F_a** = accumulation force
- W_a** = weight of the accumulating products in Kg/m (or lb/ft).
- L_a** = length of accumulation in m (or ft)
- μ** = coefficient of friction between chain and product.

SIDE TRANSFER ACTION:

Pushing the product sideward creates a force F on the product against the side guide.

$$F = F_a * \sin(\alpha) = W_a * L_a * \mu * \sin(\alpha)$$

(see explanation of symbols above)

Nowadays, can and bottle wall thickness is becoming thinner and thinner. At the same time, more installations are running with less or no lubrication, thus increasing the coefficient of friction (unless they utilize our NGE / Nolu®-S parts solution). That's why it's important to take also the forces on the products into consideration.

In the above-mentioned formula, the angle **α** plays an important role in a smooth transfer and reduced forces on the products. This angle should be kept as small as possible. One should also consider the nesting pattern of cans and bottles during a side transfer to optimize guide rail geometry.

CALCULATION OF SIDE GUIDE DISTANCE:

$$\text{SIDE GUIDE DISTANCE } X = D + (N-1) * A$$

Where:

- D** = Product diameter
- N** = Number of product rows
- A** = product-product center distance = $\sqrt{0.75 * D^2}$

— SIDE GUIDE

90° PRODUCT TRANSFER WITH BELTS

GENERAL CALCULATION

90° PRODUCT TRANSFER:

When transferring products from one conveyor to another at a 90° angle, it's common practice to use full radius guide rails with dead plates which span the space between the infeed and outfeed conveyors. Products moving along the full radius guide rail exert high pressure on the rail and on each other, easily resulting in damage.

The parabolic guide rail distributes the pressure better along the outer guide rail. This results in significantly less potential for damage on products or deflection of the guide rail. However, on the inside corner of the curve, extra room must be created for an extended dead plate "dead area".

The use of the System Plast® active transfer wing system will eliminate the dead plate and further reduce the pressure on products and side guides.

THERMAL EXPANSION

GENERAL CALCULATION

THERMAL EXPANSION

Due to temperature variation, the belt width can change according to the delta temperature. The belt width variation is function of the delta temperature and the belt material itself. See below formula for thermal expansion calculation.

CALCULATION:

Expected expansion ΔW [mm or in];

$$\Delta W = W * \Delta T * f$$

W = belt width [m] or [in]

ΔT = temperature difference (Operating temperature - Ambient temperature at manufacturing site) [°C] or [°F]

f = thermal expansion factor (material property) or Linear Thermal Expansion Coefficient [mm/m/°C] or [in/in/°F]

MATERIAL	THERMAL EXPANSION FACTOR F	
	[mm/m/°C]	[in/in/°F]
LF (Acetal)	0.12	6.66E-5
NG®evo conveyor components made from engineered plastic resin (PBT)	0.13	7.22E-5
PP (Polypropylene)	0.15	8.33E-5
HT (PA)	0.08	4.44E-5
XT (PPS)	0.26	1.44E-4

To be able to absorb the thermal expansion the belt needs some clearance on the side. Depending on the expected temperature difference the structure should be wide enough to make sure the belt will not get stuck at high temperatures or, in case of low temperatures, be small enough to still support the belt at low temperatures.

The total clearance per side to be considered is (indicative values):

BELT NOMINAL WIDTH		TOTAL CLEARANCE (*)	
$W < 500$ mm	$W < 20''$	4 mm	0.16''
$500 < W < 1500$ [mm]	$20'' < W < 60''$	6 mm	0.24 ''
$1500 < W < 3000$ [mm]	$60'' < W < 120''$	8 mm	0.32''
$W > 3000$ mm	$W > 120''$	10 mm	0.39''

(*) For PP belts, please consider the extra dimension due to material expansion during molding process in the clearance calculations.

NOMINAL WIDTH TOLERANCE

The standard tolerance on the nominal width of belts/chains made in Acetal (LF, POM-EC) or Polybutylene terephthalate (NGE) is **+0 / - 0,5 %**.

The standard tolerance on the nominal width of belts/chains made in Polypropylene (PP, PP-FR-EC, CR) is **+1 % / +2 %**.

The standard tolerance on the nominal width of belts/chains made in Acetal (POM-AS) is **0 / +0.6 %**.

CONSIDERATION OF THERMAL INFLUENCES

1. Calculate the thermal width expansion " ΔIW "
2. Calculate the thermal belt elongation " ΔIE "
3. Determine the catenary height " H "

NOTE: THESE CONSIDERATIONS ARE NOT INCLUDING THE EXPANSION INFLUENCES DUE TO BELT TENSION!

2500RR
Construction details.
Go to:

Thermal expansion calculation:

Calculation: Expected expansion [mm] $\Delta I = W \cdot \Delta T \cdot f$

f = thermal expansion factor (of PPG: ~ 0,15 mm/m/°C or 8.33E-5 in/in/°F)

W = belt width [mm]/1000 or belt length per zone [mm]/1000

ΔT = temperature difference = (°C) - 21°C

1. Calculate the thermal width expansion " ΔIW "

Example for a belt 105" (2667 mm) width, at 80°C

$\Delta I = W \cdot \Delta T \cdot f$

$\Delta I = 2667 \text{ mm}/1000 \times (80^\circ - 21^\circ)\text{C} \times 0,15 \text{ mm}/\text{m}/^\circ\text{C}$

$\Delta IW = 23 \text{ mm}$

Thermal width expansion can also be read out of below diagram.

Belt side expansion [mm]

2. Calculate the thermal belt elongation "ΔIE" for e.g. different temperature zones in a warmer tunnel

Example for a warmer-tunnel, with a 17,5 m shaft-distance, standard conveyor design with head drive, and three temperature zones.

Zone 1 : 5 m long, 40°C

Zone 2 : 7,5 m long, 80°C

Zone 3 : 5 m long, 50°C

Note: Don't forget to count also the amount of belt of the return part, where the belt is also exposed to the several temperatures! This leads to double the elongation of the belt in each zone!

◀ back continue ▶

2500RR
Construction details.
Go to:

7 2 3 1 0 a

$\Delta IE = \Delta I_{Zone1} + \Delta I_{Zone2} + \Delta I_{Zone3}$

$\Delta I_{Zone1} = W_{Zone1} \cdot \Delta T_{Zone1} \cdot f = 5 \text{ m} \times (40 - 21)^\circ\text{C} \times 0,15 \text{ mm/m}^\circ\text{C} = 14,3 \text{ mm} \times 2 = 28,6 \text{ mm}$

$\Delta I_{Zone2} = W_{Zone2} \cdot \Delta T_{Zone2} \cdot f = 7,5 \text{ m} \times (80 - 21)^\circ\text{C} \times 0,15 \text{ mm/m}^\circ\text{C} = 66,4 \text{ mm} \times 2 = 132,8 \text{ mm}$

$\Delta I_{Zone3} = W_{Zone3} \cdot \Delta T_{Zone3} \cdot f = 5 \text{ m} \times (50 - 21)^\circ\text{C} \times 0,15 \text{ mm/m}^\circ\text{C} = 21,8 \text{ mm} \times 2 = 43,6 \text{ mm}$

$\Delta IE = 28,6 \text{ mm} + 132,8 \text{ mm} + 43,6 \text{ mm}$

$\Delta IE = 205 \text{ mm}$

Thermal belt elongation can also be read out of below diagram.

LOAD CAPACITY / TEMPERATURE GRAPH

NOTE: Mechanical properties of plastic materials degrade with the increasing temperature. The following graph indicates the remaining load capacity (%) as a function of the temperature.

2500RR
Construction details.
Go to:

7 2 3 1 0 a

LOAD CAPACITY AS A FUNCTION OF THE TEMPERATURE

EXAMPLE:

Identify the hottest section. (In the example before: section 2, 80° C)
 The allowable max. load capacity/working load of the belt in that particular section is:
 Factor 0,41 (read 41% out of diagram) x 30000 N/m = 12300 N/m.
 It can happen that the middle section of a machine is more critical with respect to belt load than the drive section, due to the fact that the temperature at the drive is lower and therefore the allowable belt tension is higher.
 This needs to be checked carefully.

1- LATERAL MOVEMENT

Auxiliary drive units underneath the belt, running at right angles to the direction of belt travel, enable lateral transfers (left- or right side sorting) of conveyed goods. It can also be used to position a product, for example in front of a palletizer. Since no push-off devices, etc., are necessary (more safe), this approach works to prevent jamming, and allows for compact, space-saving layouts and no safety guards are required.

EXAMPLE HOW TO MAKE A LATERAL MOVEMENT ON THE FLY (*)

GIVEN DATA:

Width of pack (W_p) = 240 mm;

Length of pack (L_p) = 360 mm

Capacity (P_r) = 30 p/min.

S_{out} = 150 mm

As a rule of thumbs, for a side shift with only one auxiliary belt, the minimum width of the auxiliary belt (1) should be at least 1,5 times the transversal dimension of the pack L_p .

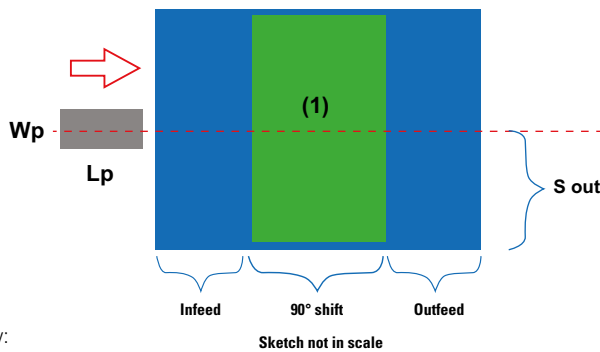

Bigger widths help in leaving more time to the movement thus reducing the speed of the auxiliary belt and consequently giving a better positioning of the pack (inertia results lower).

Minimum Width of the auxiliary belt (1) (W_a) will be calculated as follow:

$$W_a = 1,5 \times 360 \text{ mm} = 540 \text{ mm} \approx 600 \text{ mm.}$$

At the same time minimum pitch in feeding, centre to centre pack, needs to be equal or bigger than the auxiliary belt width to avoid packs to be rotated before being shifted. The minimum pitch will be equal to 600 mm.

(*) For stop and go motion the minimum width of the auxiliary belt W_a is equal to the product length L_p ($W_a = L_p$).

1 m = 3.28 ft

7 3 5 3 4 a

2253RTC CALCULATIONS

2253 ROLLER TOP BELT

This pitch must be realized, by means of appropriate feeding/metering conveyors (for instance equipped with VG belts) before the packs climb on the roller top belt or on the infeed static of the roller top belt.

Bigger pitches have the effect to increase the speed of the RollerTop system but not the overall dimension of the application.

◀ back continue ▶

- Pack speed V_p :

$$V_p = \frac{\text{Pitch}}{1000} * P_r = 0.6 * 30 = 18 \text{ m/min}$$

- The speed of 2253RTC belt (V_{rt}) can be calculated considering the 2253 Roller Top belt itself running fully on spheres:

$$V_{rt} = \frac{1}{2} * V_p = 0.5 * 18 = 9 \text{ m/min}$$

- Time for the pack to climb on the area (1) (t_c)

$$t_c = \frac{\text{length of pack } L_p \text{ [mm]}}{\text{pack speed } V_p \left[\frac{\text{m}}{\text{min}} \right]} = \frac{360 * 60}{18 * 1000} = 1.2 \text{ s}$$

- Time to cross the auxiliary belt area (1) (t_a)

$$t_a = \frac{\text{overall length shift area [mm]}}{\text{pack speed } V_p \left[\frac{\text{m}}{\text{min}} \right]} = \frac{600 * 60}{18 * 1000} = 2 \text{ s}$$

Once the pack is fully on the area (1) the shift can start.

If the shift is earlier activated, the pack will be turned/misaligned instead of being shifted.

Note: In case the auxiliary belt is running continuously, the dimensions of the auxiliary belt area as well as the overall footprint can be reduced. In such case a more defined and precise controls of the belts timings are required.

- The time available for the side shift (t_s) is given by the difference of the time t_a and t_c

$$t_s = t_a - t_c = 2 - 1.2 = 0.8 \text{ s}$$

The pack is supposed to come on the Roller Top area about in the middle of it.

Consequently, the total travel distance to lead the outer front of the pack completely on the bay area is the sum of S_{out} + half of product width W_p .

- Considering this, the auxiliary belt speed V_a results:

$$V_a = \frac{S_{out} + \frac{W_p}{2} \text{ [mm]}}{t_s \text{ [s]}} = \frac{150 + 120}{0.8 * 1000} = 0.34 \text{ m/s} = 21 \text{ m/min}$$

The infeed is needed to have a stable pack before the shift (head to tail passage can affect the stability of the pack). It should be at least as big as the pack length.

Infeed = $L_p = 360 \text{ mm} \approx 400 \text{ mm}$;

The outfeed is recommendable but not mandatory. The outfeed dimensions should be in the same dimension range of the infeed.

Outfeed = Infeed = 400 mm

The overall footprint or length of the roller top and auxiliary conveyor system will be the sum of infeed, outfeed and shift area length.

Overall footprint = (400 + 600 + 400) mm = 1400 mm.

1 m	= 3.28 ft
1 m/min	= 3.28 ft/min
1 m/s	= 3.28 ft/s

For a proper rotation, the diameter of the disk (D_{TD}) should be in the same range of the dimension of diagonal of the pack. Slightly bigger disks help in reducing the need of a precise placing in the centre of it. In case of big diagonal dimension, if possible, reduce the dimension of the disk to not expose ball placed on the outer diameter to too quick accelerations. Movement would result longer since less balls in contact.

• Disk diameter can be calculated as follow:

$$D_{TD} = \sqrt{W_p^2 + L_p^2} = \left(\sqrt{240^2 + 360^2} \right) \text{ mm} = 432 \text{ mm} \approx 450 \text{ mm}$$

At the same time minimum pitch in feeding, centre to centre pack, needs to be equal or bigger than the turning disk diameter. This to avoid the pack to be rotated when the previous pack is still on the turning disk area. The minimum pitch will be equal to 450 mm.

This pitch must be realized, by means of appropriate feeding/metering conveyors (for instance equipped with VG belts) before the products climb on the 2253RTC or on the infeed static of the roller top belt.

Bigger pitches have the effect to increase the speed of the RollerTop system but not the overall dimension of the application.

• The product speed V_p will be as follow:

$$V_p = \frac{\text{Pitch}}{1000} * P_r = 0.45 * 30 = 14 \text{ m/min}$$

• The speed of 2253RTC belt (VRT) can be calculated considering the 2253 Roller Top belt itself running fully on spheres:

$$V_{\pi} = \frac{1}{2} * V_p = 0.5 * 14 = 7 \text{ m/min}$$

1 m	= 3.28 ft
1 m/min	= 3.28 ft/min
1 m/s	= 3.28 ft/s

2253RTC CALCULATIONS

2253 ROLLER TOP BELT

The time available for the rotation (tr) will be as follow:

$$t_r = \frac{\text{Pitch}}{1000 * V_p} = \frac{450}{1000} * \frac{60}{14} = 1.93 \text{ s}$$

The angular speed ω can be calculated through below formula:

$$\alpha = \omega * t_r$$

$$\text{So } \omega = \frac{\alpha}{t_r} = \frac{\pi}{1.93} = 0.81 \text{ rad/s} = 49 \text{ rad/min}$$

Note: in this configuration, the conveyor must be stopped while the pack is rotating, and the pack should be as close as possible to the centre of the disk.

The infeed is recommended but not mandatory to have a stable product on conveyor before the rotation.

The infeed length should be at least as big as the pack: 360 mm ≈ 400 mm

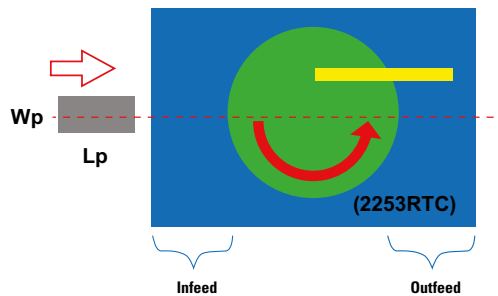

The outfeed is recommended too but not mandatory.

The outfeed length should be in the same dimension range of the dimension of the pack once rotated (i.e Wp): 240 mm ≈ 250 mm

The overall footprint or length of the roller top and turning disk system will be the sum of infeed, outfeed and rotation area diameter.

Overall footprint = (400 + 450 + 250) mm = 1100 mm.

Alternately, by placing a roller guide (in yellow) as shown in the sketch below is possible to keep the disk always in motion avoiding the stop of the conveyor during rotation.

7 2 2 9 0 a

2253RTC
Applications.
Go to:

7 2 6 2 5 a

- Width of pack (W_p) = 240 mm;
- Length of pack (L_p) = 360 mm
- Capacity (P_r) = 30 p/min.
- Rotation angle (α) = 90°

The minimum product pitch, centre to centre pack, needs to be equal or bigger than the product diagonal (D) in order to avoid product touching each other during the rotation.

- The minimum pitch will be equal to

$$\text{Pitch} = D = \sqrt{W_p^2 + L_p^2} = \left(\sqrt{240^2 + 360^2} \right) \text{ mm} = 432 \text{ mm} \approx 450 \text{ mm}$$

This dimension is also corresponding to the minimum product pitch in feeding, centre to centre pack. This pitch must be realized, by means of appropriate feeding/metering conveyors (for instance equipped with VG belts) before the packs climb on the 2253RTC or on the infeed static of the roller top belt.

1 m = 3.28 ft

2253RTC CALCULATIONS

2253 ROLLER TOP BELT

◀ back continue ▶

Bigger pitches have the effect to increase the speed of the RollerTop system but not the overall dimension of the application.

- The pack speed V_p will be as follow:

$$V_p = \frac{\text{Pitch}}{1000} * P_r = 0.45 * 30 = 14 \text{ m/min}$$

- The speed of 2253RTC belt (V_{RT}) can be calculated considering the 2253 RollerTop belt itself running fully on spheres:

$$V_{RT} = \frac{1}{2} * V_p = 0.5 * 14 = 7 \text{ m/min}$$

It is recommended to keep the length of auxiliary belts (1) e (2) at least equal 1,5 times the diagonal (D) of the product. So, the minimum length of auxiliary belts (1) and (2) will be:

$$L_a = 1.5 * D = 1.5 * 450 \text{ mm} = 675 \text{ mm} \approx 700 \text{ mm}$$

The time to cross (t_a) the auxiliary belt area (1) and (2) will be as follow:

$$t_a = \frac{\text{overall length shift area } L_a [\text{mm}]}{\text{pack speed } V_p [\frac{\text{m}}{\text{min}}]} = \frac{700}{1000} * \frac{60}{18} = 2.33 \text{ s}$$

Considering V_1 and V_2 the speeds given to the spheres by the auxiliary belts (1) and (2) underneath.

The speed of the gravity centre of the product is 7 m/min.

- Considering the angular speed ω of the pack the following relations are valid:

$$\alpha = \omega * t_a$$

$$\text{So } \omega = \frac{\alpha}{t_a} = \frac{\frac{\pi}{2}}{2} = 0.79 \text{ rad/s} = 47 \text{ rad/min}$$

1 m	= 3.28 ft
1 m/min	= 3.28 ft/min
1 m/s	= 3.28 ft/s

2253RTC CALCULATIONS

2253 ROLLER TOP BELT

The required difference speed to rotate the product will be:

$$(V_1 - V_2) = 0.79 * 225 = 0.17 \text{ m/s} = 11 \text{ m/min}$$

◀ back continue ▶

Another way to calculate the difference in speed of balls can be used. See following relation:

Considering V_{a1} , the speed given to the auxiliary belt (1) and opposite in respect to V_1 (actual speed of balls under auxiliary belt (1));

2253RTC
Construction details.
Go to:

7 2 2 9 0 a

2253RTC
Applications.
Go to:

7 2 6 2 5 a

Similarly, but opposite in running direction is V_{a2} :

Thus:

$$(V_1 - V_2) = 2 * V_{RT} + V_{a1} - (2 * V_{RT} - V_{a2}) = V_{a1} + V_{a2} = 11 \text{ [m/min]}$$

From the above relation is therefore possible to determine the real speeds V_{a1} and V_{a2} of the auxiliary belts by combining two speeds at choice V_1 and V_2 .

For instance, considering fixed the difference in speed ($V_1 - V_2$):

$$(V_1 - V_2) = 11 \text{ m/min ;}$$

$$V_1 = 20 \text{ m/min ;}$$

$$V_2 = V_1 + 11 \text{ m/min} = (20 + 11) \text{ m/min} = 31 \text{ m/min.}$$

The auxiliary belt (1) will run in the same sense of the main belt with a speed V_{a1} .

$$V_{a1} = V_1 - 2 * V_{RT} = (20 - 7 * 2) \text{ m/min} = 6 \text{ m/min}$$

While the auxiliary belt (2) will run in the opposite sense of the main belt with a speed $V_{a2} = 31 - 7 * 2 = 17 \text{ m/min}$

$$V_{a2} = V_2 - 2 * V_{RT} = (31 - 7 * 2) \text{ m/min} = 17 \text{ m/min}$$

1 m	= 3.28 ft
1 m/min	= 3.28 ft/min
1 m/s	= 3.28 ft/s

2253RTC CALCULATIONS

2253 ROLLER TOP BELT

◀ back

In case of use of two speeds opposite to the running direction of the product (Fig. A), the following relation is valid:

$$(V_1 - V_2) = 2 * V_{RT} + V_{a1} - (2 * V_{RT} + V_{a2}) = V_{a1} - V_{a2} \text{ m/min}$$

This configuration requires higher speeds of the auxiliary belts and has the main advantage of the better control and stable product rotation.

At last, it is also possible to use a fixed plate instead of one of the two auxiliary belts (Fig. B).

This solution makes application cheaper (one less drive and auxiliary belt) but has the disadvantage to lead to an higher speed of the auxiliary belt, thus potential higher wear rate.

The infeed is needed to have a stable pack before the rotation (head to tail passage can affect the stability).

The infeed length should be at least as big as the product length: 360 mm ≈ 400 mm

The outfeed is recommended too but not mandatory.

The outfeed length should be in the same dimension range of the dimension of the pack once rotated (Wp): 240 mm ≈ 250 mm.

The overall footprint or length of the roller top and auxiliary belts system will be the sum of infeed, outfeed and shift area length.

Overall footprint = (400 + 700 + 250) mm = 1350 mm.

Fig. A

Fig. B

Note: The SSL (Short Side Leading) rotation is generally less efficient than LSL (Long Side Leading) since the number of balls in contact at the beginning as well as arm of rotation is smaller.

Rotation could therefore seem not to start immediately and then be sudden.

In case of high speed differentials of $(V_1 - V_2)$ is recommendable to increase the auxiliary belts area (the length) to speeds lower and thus realize a smoother rotation.

For a properly working rotation we advise a **length/width ratio of max. 2**

1 m	= 3.28 ft
1 m/min	= 3.28 ft/min
1 m/s	= 3.28 ft/s

BEARING SELECTION

BEARING

continue ►

BEARING SELECTION:

The following general information will serve the purpose of aiding the machine designer or bearing user when applying the bearings covered in System Plast® catalog.

Before beginning the bearing selection for a particular application, it is important to have a good idea of where the bearing will be installed, what its purpose will be, what operating conditions will the bearing be expected to function in, and a desired bearing life. Each bearing type has certain characteristics which make it suitable for a certain application(s). Having comprehensive knowledge of these requirements will aid in bearing selection. In most cases, there are several factors to consider when choosing a bearing type. Therefore, the following information is to be used only as a guide. In the selection process the following factors must be considered:

magnitude and direction of load; misalignment (static or dynamic), noise; vibration and shock loading, environment and bearing type.

Bearing mounting. Go to:

7 3 0 5 2 a ►

LOAD - MAGNITUDE AND DIRECTION

Load magnitude typically dictates size of bearing required but it can also affect the type of bearing. Ball bearings work well in light to moderate loads typical of conveyor applications. Load direction can be radial, axial, or a combination of these two directions. These directions along with load magnitude are deciding factors in selection of bearing type.

System Plast® bearings are mostly used in application where there are only radial load or radial loading plus slight axial load.

Radial loading is the most common type of bearing load and is defined as a load perpendicular to the shaft center line. Most ball bearings are designed to accept primarily radial loads.

Axial loading is defined as loading in the direction through the shaft centerline.

Combination loading consists of both a radial and a thrust load acting simultaneously on the bearing. When combination loads are acting on a bearing it is necessary to determine an equivalent radial load when calculating bearing life.

MISALIGNMENT

Bearing misalignment is a result of angular misalignment between the shaft and housing. This misalignment comes in two different forms, static and dynamic. Static misalignment is the outcome of bearings that are mounted on different planes causing an angular shaft displacement and resulting in the bearing operating under fixed misalignment angle. Mounted ball bearings have a design feature that allows them to accommodate a limited degree of fixed misalignment. Dynamic misalignment is an eccentric shaft rotation caused by shafting imperfections and resulting in the bearing operating under a varying misalignment angle.

Static System Misalignment

Dynamic System Misalignment

Each bearing type is capable of accommodating a certain amount of either static, dynamic, or combination misalignment. When application misalignment exceeds the allowable limit for the particular bearing, increased contact stresses between bearing rolling elements and raceways occurs and bearing life is reduced. Individual product sections contain additional information regarding degrees of misalignment each bearing type is capable of handling.

7 3 5 4 3 a

BEARING SELECTION

BEARING

NOISE:

Noise sensitive applications require smooth running of bearings. These are typically low duty environments which makes ball bearings a good choice. Concentric or Skwezloc® locking mechanisms are preferred to keep vibration at a minimum.

◀ back continue ▶

VIBRATION AND SHOCK LOADING:

Vibration and shock loading can be present in some applications and can transfer large forces to bearings and accompanying raceways. These loads create large stresses at the interface between the rolling elements and raceways and can cause considerable damage and a reduction of bearing life.

Bearing mounting.
Go to:
7 3 0 5 2 a ▶

ENVIRONMENT:

Environmental factors such as solids contamination exposure to moisture and thermal conditions are important variables in bearing selection. Bearing components (seals, grease, bearing material, etc..) can be modified in order to better suit a specialized application. Availability of special features may be affected by shaft size, bearing type, and housing type therefore this must be considered in the bearing selection process. Individual product sections contain additional information regarding these specialized features and availability.

BEARING TYPE: RADIAL BALL BEARINGS

Radial ball bearings create a fairly small elliptical contact between the ball-path and rolling element thus distributing loads across a small area. Surface contact is minimized and less friction and heat is generated which allows ball bearings a higher speed range. This small contact area also limits ball bearings to accepting only light to moderate loads. Radial ball bearings have a zero-degree free contact angle but can accept light thrust loads (in combination with a radial load) due to the shape geometry of their raceways. Mounted ball bearing units have some degree of external static self-aligning capability (the bearing insert can misalign with respect to the housing). Mounted ball bearings come in a variety of housing styles and features to suit a wide variety of applications. Only "radial" ball-bearing type are available from System Plast® product range.

BEARING AND SHAFT

BEARING

SHAFT SIZE:

THE SHAFT MUST FULFILL THE FOLLOWING CONDITIONS:

- Maximum shaft deflection F_{max} under full load (F_w) is 2,5 mm (0.10 in). If the calculated shaft deflection exceeds this max value, select a bigger shaft size or install an intermediate supported bearing on the shaft.
- Torque (**Ts**) at maximum load must be below critical value;
Shaft maximum deflection under concentrated load applied in the center can be calculated with following formula:

continue ►

Bearing mounting.

Go to:

7 3 0 5 2 a

2 BEARINGS

$$f = \frac{5}{384} * F_w \frac{l_b^3}{E * I} \text{ [mm]: } F_w \text{ [N], } l_b \text{ [mm], } I \text{ [mm}^4\text{], } E \left[\frac{\text{N}}{\text{mm}^2} \right]$$

$$f = \frac{5}{384} * F_w \frac{l_b^3}{E * I} \text{ [in]: } F_w \text{ [lb], } l_b \text{ [in], } I \text{ [in}^4\text{], } E \left[\frac{\text{lb}}{\text{in}^2} \right]$$

3 BEARINGS

$$f = \frac{1}{370} * F_w \frac{l_b^3}{E * I} \text{ [mm]: } F_w \text{ [N], } l_b \text{ [mm], } I \text{ [mm}^4\text{], } E \left[\frac{\text{N}}{\text{mm}^2} \right]$$

$$f = \frac{1}{370} * F_w \frac{l_b^3}{E * I} \text{ [in]: } F_w \text{ [lb], } l_b \text{ [in], } I \text{ [in}^4\text{], } E \left[\frac{\text{lb}}{\text{in}^2} \right]$$

For uni-directional head drive $F_w = T_s$,

For bi-directional center drive $F_w = 2 * T_s$,

For uni-directional pusher drives $F_w = 2.2 * T_s$,

For modulus of elasticity (E) use: 200.000 N/mm² or 28.500.000 lb/in². Values are for carbon steel (C50) or stainless steel AISI 304/316. Modulus of elasticity for other materials can be referenced via industry standards.

BEARING CALCULATIONS FOR SERIES UC AND UF:

STATIC LOAD CALCULATION:

In case the bearing is loaded without rotating, very slowly rotating or is making a slow oscillating movement, the bearing power is not determined by the fatigue life of the material but by the deformation of the rollers and the groove. This calculation is also valid if at a fraction of the rotation a shock load is present.

$$P_0 = X_0 * F_r + Y_0 * F_a = 0.6 * F_r + 0.5 * F_a$$

P_0 equivalent static load [N];

X_0 radial static factor;

F_r radial load [N];

Y_0 axial static factor;

F_a axial load [N];

Bearing mounting.
Go to:
7 3 0 5 2 a ▶

P_0 is calculated when there is not only a radial component in the load but also an axial component.

When the load on the bearing is strictly radial the equivalent static load $P_0 = F_r$.

The minimum static load coefficient C_0 is calculated while taking into account the static safety factor S_0 .

Then in the bearing tables the right size bearing can be found checking the C_0 .

$$C_0 = S_0 * P_0$$

C_0 static load coefficient in [N]

S_0 static safety factor;

$S_0 = 1$ for normal circumstances,
= 1.5 when vibrations are involved and
= 2 - 2.5 for noiseless applications.

DYNAMIC LOAD CALCULATION:

For normal circumstances, the dynamic load coefficient is calculated and compared to the equivalent dynamic load to determine the theoretical service life of the bearing. The calculated service life is then compared to the standard for the application and industry.

$$L_{10} = \left(\frac{C}{P} \right)^3$$

L_{10} = nominal life time in millions of revolutions
 C = dynamic load coefficient in [N]
 P = equivalent dynamic load [N]

When bearings run at constant speed, their life can be determined in working hours:

$$L_{10h} = \frac{1.000.000}{60n} * \left(\frac{C}{P} \right)^3$$

L_{10h} = life in hours.
 n = speed [rpm].

When the load on the bearing is strictly radial the equivalent dynamic load $P = F_r$.

When there's also an axial load involved the equivalent dynamic load is:

$$P = X * F_r + Y * F_a$$

C45

CARBON STEEL: S AND SR

C45 steel material allows a higher yield load capability than stainless steel but is not corrosion resistant, thus only suitable for dry environments. Oil lubrication may be necessary to reduce rust and drag. The through hardened plate material provides a uniform hardness and a high abrasion resistance.

FEATURES:

- Surface hardness: 44 HRC

BENEFITS:

- High mechanical strength
- High abrasion resistance

STANDARD

STANDARD STAINLESS STEEL: SS AND SSL

AISI 430 Stainless steel material with good mechanical characteristics and corrosion resistance. An economical option for many conveying applications.

Lower load and lower wear resistance capability than our higher grade stainless steel materials.

FEATURES:

- Standard stainless steel

BENEFITS:

- Food grade
- Economical solution

EXTRA PLUS

EXTRA PLUS STAINLESS STEEL: SSE, SSSR, SSEL AND SPSL

High performance stainless steel, specially developed for high speed and heavy-duty application. Offers excellent corrosion resistance and surface hardness.

FEATURES:

- Surface hardness of HRC 26-30
- Extremely flat and smooth surface finish
- High corrosion and wear resistance
- Highest ultimate yield loading capability

BENEFITS:

- Food grade
- Typically used in glide liners and pressureless combiners and very long conveyors
- For improved product stability

AUSTENITIC

AUSTENITIC STAINLESS STEEL: SSA

AISI 304 Austenitic stainless steel which offers high corrosion and acid resistance properties.

FEATURES:

- Stainless steel with 18% chrome and 8% nickel

BENEFITS:

- Food grade
- High corrosion and acid resistance material

HIGH STRENGTH	FOOD GRADE	MEDIUM HIGH SPEED	VERY HIGH SPEED	CORROSION RESISTANCE	CHEMICAL RESISTANCE

7 3 5 6 1 a | PIN MATERIALS FOR STEEL AND PLASTIC CHAINS

MATERIALS

◀ back continue ▶

SPM

STANDARD PIN MATERIAL

Special austenitic stainless steel with higher tensile strength and improved surface hardness. These pins are offered as standard in most stainless steel and plastic chains.

FEATURES:

- High wear, corrosion and acid resistance

BENEFITS:

- Longer wear life

HB

SPECIAL PIN MATERIAL

Vacuum hardened stainless steel with exceptionally high wear resistance characteristics, good corrosion and chemical resistance, for high speed and or abrasive applications with steel chain.

Pin wear is the main contributing factor in chain elongation.

Due to their extraordinary hardness, HB pins offer a much better resistance against mechanical/abrasive wear and thus extended service life of chain.

HB (Harten Bolzen) pins are recommended for the following operating conditions and applications:

- Abrasive environment (e.g. crate and bottle conveyors)
- Short conveyors running at high speed (e.g. filler area, inspector sections, pressure less combiners)
- High load applications (e.g. accumulation area, full crate conveyors, full bottle accumulation tables, keg lines)

FEATURES:

- Hardness > HRC 48

BENEFITS:

- Ultimate abrasion resistance
- Outstanding wear life
- Wear resistance twice of standard pin

AS

ANTI-STATIC ACETAL RESIN

Anti-static acetal material with improved surface conductivity for greater protection against static electrical discharges.

Color: Black (AS)

FEATURES:

- Antistatic

BENEFITS:

- Dissipates nuisance static build-up

HT

HIGH TEMPERATURE RESISTANT

Polyamide material based for high temperature applications up to 140°C.

Color: Natural white

BENEFITS:

- High temperature resistance
- Food grade

XT

EXTRA TEMPERATURE

This material with fiber glass-reinforced offers an excellent heat and chemical resistance for belt/chain and a good load capacity in respect to other materials. XT is suitable for extra high temperature applications up to 240° C.

Color: Beige

BENEFITS:

- Very high temperature up to 240°C

PP

PPW

CHEMICAL RESISTANCE

For belts: polypropylene material for greater chemical and temperature resistance. Polypropylene has lower mechanical strength than acetal. For belts (PP) the pins and clips are also made of Polypropylene.

Color: Beige (PP), White (PPW).

BENEFITS:

- Food grade
- Higher temperature resistance
- Optimum chemical resistance

PPG

PPLG

HIGH STABILIZED HOMOPOLYMER

For belts: Polypropylene material for a greater chemical and temperature resistance. This Polypropylene is a high stabilized homopolymer, combining high impact strength and stiffness. It has been developed especially for high detergent resistance and heat stability. Apart from pasteurizers, this material is also used in industrial washing machines, heat exchangers and dishwashers.

Color: Dark Grey (PPG), Light Grey (PPLG).

BENEFITS:

- Food grade
- Higher temperature resistance
- Optimum chemical resistance

CR

For chains: reinforced polypropylene material for greater acid and chemical resistance. Polypropylene has lower mechanical strength than acetal. **Reinforced PP is not food grade.**

Color: White (CR, for chains only)

Special colours

On request and for adequate quantities, chains and belts may be produced in other colours.

RUBBER MATERIALS

MATERIALS

◀ back

TPR

TPR (SEBS)

TPR is used for VG chains and belts and for plastic gripper chains. TPR is a SEBS type rubber, which assures an optimum bonding on the plastic base material.

Mechanical properties data available on MDS.

NBR

NBR

NBR rubber is used for our gripper chains serie 1874.

It offers a soft grip and a good resistance against oils.

EPDM

EPDM

EPDM rubber is used for our gripper chains.

It offers good weather and chemical resistance, although contact with oils, gasoline and concentrated acids must be avoided.

EPDM-PP

EPDM-PP

EPDM-PP rubber is used for our gripper chains.

It offers improved chemical resistance and can be used at higher temperatures.

Resistance against steam is good.

**NOLU®-S
MATERIALS**

WHAT ARE NOLU PLASTICS?

Nolu® plastic parts are made with Regal's exclusive compounds of UHMWPE and solid lubricants/unique ingredients. They provide reduced coefficients of friction while maintaining the characteristics of UHMWPE. Our featured component brands are Nolu-S, Nolu-SR and Nolu-SX.

NOLU®-S

Nolu-S parts are made with a blend of UHMWPE and other dry lubricants that maintain good wear characteristics while significantly reducing coefficient of friction. Its unique self-lubricating properties make it ideal for applications requiring reduced friction and noise reduction.

FEATURES:

- RAM extruded or machined
- Very low coefficient of friction material flow
- High-impact strength
- Chemical resistant with minimal moisture absorption
- The Nolu®-S parts ingredients comply with EU and FDA food regulations
- Noise suppressant
- Easy to machine - most general power tools are sufficient

BENEFITS:

- Extends the life of mating surfaces
- Reduce surface marring and damage
- Reduces energy consumption
- Minimizes product pulsation on conveyors
- Low noise operation

NOLU®-S PARTS MATERIALS

◀ back

NOLU®-SR PARTS

Nolu-SR parts have the same unique self-lubricating properties as Nolu®-S parts, however, they are made with additional proprietary ingredients. These unique ingredients increase the hardness of the material, providing superior wear resistance as compared to standard UHMWPE. Benefits of Nolu-SR parts include high wear resistance, extended wear life, minimization of product pulsation and low noise.

FEATURES:

- RAM extruded or machined
- Superior wear resistance - greater than standard virgin or repro material
- Low coefficient of friction - promotes material flow
- High-impact strength
- The Nolu-SR parts are made with ingredients that comply with EU and FDA regulations
- Chemical resistant with minimal moisture absorption
- Easy to machine - most general power tools are sufficient

BENEFITS:

- Even greater wear resistance
- Extends the life of mating surfaces
- Reduce surface marring and damage
- Reduces conveyor chain loads
- Reduces energy consumption
- Reduces product pulsation on conveyors
- Low noise operation
- Suitable for running dry at higher speed

NOLU®-SX PARTS

Nolu-SX parts has the same unique self-lubricating properties as Nolu-SR parts; however, Nolu-SX parts has a material blend that reduces the thermal expansion characteristics of the material. The thermal expansion is reduced up to 40% compared to standard UHMWPE products, making it the ideal material for neck guides.

Nolu plastics should be stored at room temperature between 50°F (10°C) and 104°F (40°C) to prevent premature aging of the material. They should also be stored in a manner to prevent distortion. Regular cleaning is also recommended with warm water and soap agents with a pH value of 4.5 to 9.0. For more technical information regarding Nolu parts, please contact our Application Engineering Group.

MATERIALS

CURVES, WEARSTRIPS AND SIDE GUIDE MATERIALS

UHMWPE GREEN

ULTRA-HIGH MOLECULAR WEIGHT POLYETHYLENE (UHMWPE)

This Polyethylene polymer with extremely high molecular weight has several unique properties such as high abrasion resistance, impact strength and low coefficient of friction. The UHMWPE are used for our side guide profiles, curves and wearstrips.

UHMWPE BLACK

UHMWPE WHITE

UHMWPE WATER BLUE

UHMWPE-AS BLACK

ANTISTATIC ULTRA-HIGH MOLECULAR WEIGHT POLYETHYLENE (UHMWPE-AS)

This PE polymer with extremely high molecular weight has several unique properties such as good wear resistance, good impact strength, good sliding and antistatic properties. These properties make the material suitable for curves and straight tracks.

Surface Resistivity: $10^3 - 10^4 \Omega$; Volume Resistivity: $10^3 - 10^4 \Omega \cdot \text{cm}$.

NOLU®-CP

NOLU®-CP PARTS

Nolu-CP parts are made with Regal's exclusive compounds of UHMWPE and micro glass beads. Curves and neck guide made with this material are the most suitable for abrasive working conditions.

POM - GREEN

POM-ACETAL

This polyacetal used for roller guide provide a high rigidity, hardness and toughness and good chemical resistance to alkalis.

POM - WHITE

SPROCKETS, IDLER MATERIALS

PA BLACK

GLASS FIBER REINFORCED POLYAMIDE (PA-FV)

The reinforced polyamide with glass fiber is used for molded sprockets and idlers to offer a high strength and wear resistance.

PA WHITE

POLYAMIDE (PA)

The cast polyamide 6 is used for machined sprockets and idlers to offer a high strength and wear resistance.

RETURN ROLLERS MATERIALS

PE-HD BLACK

HIGH-DENSITY POLYETHYLENE (PE-HD)

The high-density polyethylene is used for return roller and it has a good abrasion resistance, impact strength and a low coefficient of friction.

PE-HD GREEN

PA BLACK

POLYAMIDE (PA)

The impact polyamide resin is used for return roller to offer a high strength and wear resistance.

PA GREEN

7 3 5 7 6 a | STORAGE OF PLASTIC CHAINS AND BELTS AND RoHS MATERIALS

STORAGE OF PLASTIC CHAINS AND BELTS

Plastic chains, belts and components offer best stability and resistance against environmental effects at appropriate storage:

- In the original packaging, and not exposed to the environment
- Without environmental radiation / UV light / direct sunlight
- Dry
- In a non-aggressive environment
- A consistent temperature between 10°C (50° F) and 40°C (104° F)

FIRST IN, FIRST OUT

- We have applied that procedure in our logistic department.
- We recommend this procedure to any external warehouse.

Do not stack pallets or other heavy goods on top of chain packs. Chains inside the packs might get damaged.

Do not stack chain packs higher than the original stacking height - as dispatched from our shipping department.

DISPOSAL OF PRODUCTS

◀ back

DISPOSAL OF PLASTIC CHAINS AND BELTS

The non-electric nor electronics waste (plastic, rubber and metals parts) are not considered special waste and must be disposed of in strict compliance with the local regulations regarding non-special waste.

DISPOSAL OF MODSORT® MODULES

The wood packaging material of Modsort® modules is fully recyclable and FITOK certified in accordance with the ISPM-15 regulation.

The electrical and electronic parts of Modsort® modules listed below are marked with the symbol

and classified as Waste of electric and electronic equipment (WEEE) in accordance with the European Directive 2012/19 / EU on WEEE.

- Control Card
- Divert Belt and Roller Top Belt's Motorized Drive Rollers (MDRs)
- Photo eyes
- Power Supply Unit

These WEEE must be disposed correctly at a suitable collection point according to the procedures in use in the country of disposal.

7 3 5 8 0 a COEFFICIENT OF FRICTION - MEASUREMENT PROCEDURE

MATERIALS

In this section, we will describe the measurement method for coefficient of friction (COF or μ) between belt/chain and product on a running conveyor.

The COF is defined as the ratio between the force necessary to move one surface horizontally over another and the pressure between the two surfaces. It can be measured by dividing the force required to push or pull an object by its weight. The pull and the product weight can be determined by measurement using a spring or force gauge. Please follow the below instructions, ensuring both conveyor and sample product are clean and clear of all debris:

1- At first be sure to have:

- a. Mechanical or digital spring gauge with suitable sensitivity and accuracy
- b. A spirit level gauge (in case of inclined conveyor)
- c. A suitable sample of product weight (bottles/cans etc.)
- d. Available space on the running conveyor where the COF measurement is required

For iCOF® device.
Go to product page:

5 7 0 8 0 a

2- Measure the sample weight (W):

- a. Use sample product with suitable weight. It is recommended to collect one or more products to get 1 kg of product weight.
- b. Measure the product weight using a scale or spring gauge
- c. Record the value when the scale is stabilized

3- Measure the pull (F₀):

- a. Be sure that conveyor is running and the surface is level. Otherwise measure carefully the angle
- b. With the same sample as step 2.a), take measurements in the same location on the conveyor and at the same speed if possible
- c. Secure the gauge to a fixed point on the conveyor or hold the gauge by hand avoiding movements.
If possible, steady your hand by resting it on conveyor frame or guide rail
- d. Ensure that the gauge is parallel to the conveyor
- e. Put the sample product on the conveyor, attach to spring gauge, and measure the horizontal pull (F₀).
- f. Take the value when the measurement is stabilized
- g. Make three (03) measurements at the same conditions
- h. Make the average of the obtained three (03) values
- i. Repeat steps 2 and 3 for multiple different containers

4- COF calculation:

- a. Be sure that the average **W** and **F₀** values are in the same measurement unit (g or kg or lb);
- b. Use the formula $\mu = \frac{F_0}{W} = \frac{\text{measured pull}}{\text{measured weight}}$ to obtain the average value of COF; (4b)

Be aware that for some gauges it is required to compensate the reading with the plunger weight (P) (1) since it is used horizontally. Refer to page **7 3 5 8 1 a** for further details.

With the plunger weight compensation, the formula 4b) becomes:

$$\mu = \frac{(F_0 + P)}{W} = \frac{\text{measured pull} + \text{plunger weight}}{\text{measured weight}}$$

If the conveyor is inclined with respect to the running direction, the angle α is to be considered as following:

- Measure the angle α (usually from 2° to 5°);
- Use the formula $\mu = \frac{(F_0 + P)}{W \cos \alpha} - \tan \alpha$ (Running direction downwards) (1).
- Use the formula $\mu = \frac{(F_0 + P)}{W \cos \alpha} + \tan \alpha$ (Running direction upwards) (1).

Notes: (1) P=0 for spring gauges with adjustable preload. Refer to good measurement practice for further details.

7 3 5 8 1 a COEFFICIENT OF FRICTION - GOOD MEASUREMENT PRACTICE MATERIALS

Here we describe good practices when measuring the COF within belt/chain in a running conveyor.

SELECTION OF THE INSTRUMENT

The higher the sensibility, the more accurate the measurement. 10 g divisions and +/- 10% (or ounces) is a good compromise for a rough estimation.

A. Gauge with mechanical spring (0-10 kg)

- i. Needs certain weight
- ii. Needs to compensate spring preload and “plunger”
- iii. Is more accurate / repeatable

There are spring gauges on the market with adjustable preload, in order to compensate the plunger. For those types of gauges, just adjust the reading scale to 0 when reading in horizontal position. Remember to reset the scale to 0 when reading values in vertical position (i.e. when weighting a bottle).

B. Digital gauge (0-45 kg)

- i. Needs lower weight
- ii. Don't always need to compensate for the “plunger”
- iii. Less accurate / repeatable

REQUIRED ACTIVITIES AND CHECKS PRIOR TO MEASUREMENT

A. Gauge with mechanical spring: Plunger preload determination

- i. Prior to the measurement ensure that also the spring dynamometer reads zero when in vertical working position. Tare if necessary.
- ii. Weight the dynamometer on a balance or using a second scale. Record the value. Weight reading of the total scale $x = A$ plunger preload + B scale body [g]
- iii. Hang the dynamometer upside down. If the instrument's own weight is not enough to pull the plunger by at least 10% of his own full scale, hang some additional weight at the bottom. The additional weight should be deducted from the reading.
- iv. Weight reading of the scale upside-down $y = B$ scale body - A plunger [g]. Read and store the value on the scale.

v. Plunger weight (spring preload) will be $A = \frac{x - y}{2}$ RECORD THIS VALUE!

Example:

Gauge weights 140 g, upside-down reading is 36 g, the spring-preload is $(140-36)/2 = 52$ g. For the horizontal reading, you will have to add this value to the displayed forc.

7 3 5 8 2 a COEFFICIENT OF FRICTION - GOOD MEASUREMENT PRACTICE

MATERIALS

◀ back

B. Digital gauge: Plunger preload determination

If your digital tool offers the possibility to switch it to horizontal, you don't need to calculate the plunger preload. In fact, in horizontal configuration, the cell automatically pre-sets to zero.

Some digital tools, on the contrary, do not allow to be switched to horizontal (they need a certain weight, given by the plunger when lying vertically to activate the cell). Under such condition proceed in plunger preload determination as per previous point.

Periodically check your instrument and compare the measurements with a second one. This is required to check any possible deviation of measurements due to loss of tare.

Recommendations

- A higher is the sample product weight, a lower is the error in the estimated value
 - If possible, we recommend using multiple containers to increase product weight
- Measure the product weight close to the ground so as to prevent any dropped bottles from breaking
- Take a stabilized measurement. Instrument gauge has a response time, so we recommend respecting this time to read an accurate value
- The more measurements that are taken and averaged, the more reliable the result will be.
- A smooth, clean surface allows an accurate COF measurement without the influence of wear
- Using the same sample(s) in all measurements will lead to a uniform and repeatable value
- Securing the gauge to a fixed point on the conveyor will remove human error from holding the spring gauge
- Ensure you hold the gauge and the plunger parallel to the conveyor, so as to achieve an accurate measurement

7 3 5 8 6 a **CHEMICAL RESISTANCE OF STANDARD MATERIALS**
MATERIALS

Data shown in the table was taken from laboratory tests performed on unstrained samples and are merely indicative.

Chemical resistance under normal working conditions can depend on various factors, such as stress and temperature, concentration of the chemical agent and contact time. Conveyor rinsing can also be a huge factor, as a corrosive chemical that is allowed to dry and concentrate will be more problematic than one that is allowed contact for a short time and thoroughly rinsed away.

MATERIALS

Data shown in the table was taken from laboratory tests performed on unstrained samples and are merely indicative.

Chemical resistance under normal working conditions can depend on various factors, such as stress and temperature, concentration of the chemical agent and contact time. Conveyor rinsing can also be a huge factor, as a corrosive chemical that is allowed to dry and concentrate will be more problematic than one that is allowed contact for a short time and thoroughly rinsed away.

APPLICATION TEMPERATURES

MATERIALS

For low and high temperature application please consult our Application Engineering department.

Be aware:

- If a chain, belt or other component is composed of several materials, all materials will have to be considered individually.
- Please note that the properties of a material change when the temperature changes
- In general, the impact resistance is reduced at low temperatures.
- The strength and wear resistance are reduced at elevated temperatures.
- High temperatures can also influence chemical resistance
- Some materials absorb moisture and expand/swell

WHAT PLASTIC MATERIALS ARE USED IN NEW GENERATION® CONVEYOR COMPONENTS?

The System Plast® New Generation® family of chains and belts conveyor components are made of proprietary engineered resins designed to provide a sustainable advantage over “industry standard” materials. Their reduced coefficient of friction properties enable end users to reduce or eliminate their chain/belt lubrication thus providing a true “dry running” conveyor. Better sliding properties also result in reduced power consumption, increased wear life, reduced dust generation and the ability to run at higher speeds.

SYSTEM PLAST PRODUCTS ARE LEADING THE WAY WITH INNOVATION!

We introduced the New Generation® brand of conveyor components 20 years ago. It was soon recognized to offer new possibilities for running conveyors lines without lubrication. This enabled the reduction/elimination of soap & water or dry lubricants creating a safer work environment and cost savings. NG® conveyor components have also proven they provide longer wear life in comparison to acetal materials, and reduce noise levels in dry applications.

Regal expertise with unique materials and in-house integrated tool development is critical for consistent control over design and manufacturing processes.

MATERIAL EVOLUTION TO MEET YOUR GOALS

Understanding the growing demands on safety, hygiene, sustainability and TCO (total cost of ownership) - Regal challenged itself to improve the original formulation. This successful development created a new and improved resin used to make NG® Evolution conveyor components which helps to meet your goals. Your floors can be drier, bacteria growth can be reduced, energy and water consumption can be less and your TCO will be improved.

IMPROVEMENTS OF NG® EVO COMPARED TO NG® CONVEYOR COMPONENTS

- Lower friction - Friction is reduced up to 15%.
- Higher strength - Up to 10%
- Higher abrasion resistance
- Approved for direct food contact according to EU and FDA regulations

◀ back continue ▶

LOWEST COEFFICIENT OF FRICTION BETWEEN CHAIN /BELT AND WEARSTRIP

Coefficient of friction NG® evo conveyor components on UHMWPE wearstrip:

- 25% lower than LF acetal chain
- 15% lower than NG chain

Coefficient of friction values of 0,10 or even less are achievable in running dry applications

- Less power consumption
- Improved product stability
- Improved product flow
- Improved productivity

HIGHEST PLATE WEAR RESISTANCE

Plate wear in accelerated abrasion test after 5400 km run length

- 75% less wear than LF acetal chain
- 30% less wear than NG chain

Increased wear provides many advantages

- Less dust generation
- Reduced contamination
- Reduced cleaning requirements

NG® EVO CONVEYOR COMPONENTS ARE APPROVED FOR DIRECT FOOD CONTACT ACCORDING TO EU AND FDA REGULATIONS

NOISE REDUCTION:

With NG evo components the risk of noisy chains is greatly reduced compared to LF acetal chains. Squealing curves can be resolved and improve the work environment.

HIGH PV (PRESSURE VELOCITY) LIMIT:

With NG evo conveyor components, higher speeds and higher loads are achievable in dry running lines compared to LF Acetal chains. Additional speed and wear advantages can be also gained when used in combination with NOLU®-S or NOLU-SR curves.

CHEMICAL RESISTANCE:

NG evo conveyor components have a better chemical resistance than LF acetal materials, being compatible with most cleaning agents, especially in aseptic filling with the presence of H₂O₂ (hydrogen peroxide). The material in NG evo components, unlike many other materials used in the same application, do not get attacked by this chemical.

ENHANCED RUNNING DRY POSSIBILITIES WITH NG®EVO CONVEYOR COMPONENTS:

Contact Regal for assistance to help you achieve this goal.

An overview of the process is shown below :

STEP 1: GOAL TO RUN DRY

- Save water / lubricant consumption
- Eliminate wet floors • safety
- Less bacteria growth • hygiene
- Reduce maintenance
- Reduce energy consumption

STEP 2: DEFINE PROCESS PARAMETERS

- Layout
- Production / hour • speeds
- Geometry bottle, can, etc.

STEP 3: DEVELOP A ROBUST PROCESS

- Analyze the data from the previous step
- Discuss requirements and conditions with OEM and End user
- Select the correct products

STEP 4: IMPLEMENT DRY RUNNING

- Advise during installation
- Train operators

STEP 5: CONTROL AND IMPROVE PROCESS

- Monitor, follow up and make changes if necessary
- Analyze the collected data

A SUCCESS STORY OF NG® CONVEYOR COMPONENTS

◀ back

DRY RUNNING SYSTEM PLAST® CONVEYOR COMPONENTS HELP HEINEKEN BREW A BETTER FUTURE WITH WATERLESS BOTTLING CONVEYORS IN ZOETERWOUDE PLANT

THE TWO WATER FOOTPRINT NETWORK PARTNERS TEAM UP TO IMPROVE PLANT SAFETY AND SUSTAINABILITY BY REDUCING WATER USE, ENERGY CONSUMPTION, AND SOUND LEVELS AT ZOETERWOUDE BREWERY.

Zoeterwoude, Netherlands 2014 - Heineken* N.V.'s global sustainability strategy, known as "Brewing a Better Future," produced a company-wide reduction of 20 percent in water use between 2008 and 2013. Playing a role in that improvement are System Plast NG® conveyor chain/belts and NOLU®-S wear track from System Plast S.r.l., a subsidiary of Regal Beloit Corporation (referred to from here on as "Regal"). The ultra-low-friction components, which are being deployed in phases at Heineken's Zoeterwoude brewery, eliminate the need for water and chemical-based lubrication on the filling lines - including those where abrasive particles from aluminum cans, party kegs and returnable glass bottles have been a problem in the past.

According to managers at the brewery, the dry running conveyor is producing a cascade of sustainability improvements with a cleaner, quieter, more energy-efficient and reliable plant. "We have experienced a wide variety of gains from the System Plast dry running conveyor," said Mr. Cok Duivenvoorden, Technical Line Manager at Zoeterwoude. "Specifically, we have improved plant safety and hygiene with dry equipment and floors. Maintenance is easier because of the cleanliness and better access where drip trays have been removed. We have reduced costs for water, lubricating chemicals and wastewater discharge. Dry operation is easier on conveyor bearings and frames, yet still reduces energy consumption because of the low-friction components. System Plast NG chain lasts up to five times longer than low-friction acetal in some of our applications. And when installed to replace worn-out conveyor, the new chain pays for itself in as little as a year."

A JOINT GOAL TO REDUCE WATER USE IN BEVERAGE PROCESSING

One goal of Heineken's "Brewing a Better Future" sustainability program is to reduce water consumption by at least 25% by 2020, and both Heineken and Regal are pursuing dry conveying solutions as members of the Water Footprint Network. The network is a global organization of businesses, governmental agencies and environmental groups that promotes the transition to sustainable use of fresh water resources through increased awareness of how production and consumption of goods affect fresh water systems.

APPLICATION CONSIDERATIONS

The proper selection and application of power transmission products and components, including the related area of product safety, is the responsibility of the customer. Operating and performance requirements and potential associated issues will vary appreciably depending upon the use and application of such products and components. The scope of the technical and application information included in this publication is necessarily limited. Unusual operating environments and conditions, lubrication requirements, loading supports, and other factors can materially affect the application and operating results of the products and components and the customer should carefully review its requirements. Any technical advice or review furnished by Regal Beloit America, Inc. and its affiliates with respect to the use of products and components is given in good faith and without charge, and Regal assumes no obligation or liability for the advice given, or results obtained, all such advice and review being given and accepted at customer's risk.

For a copy of our Standard Terms and Conditions of Sale, Disclaimers of Warranty, Limitation of Liability and Remedy, please contact Customer Service.

These terms and conditions of sale, disclaimers and limitations of liability apply to any person who may buy, acquire or use a Regal Beloit America Inc. product referred to herein, including any person who buys from a licensed distributor of these branded products.

Legend

Codes ending with .. indicate a group of item descriptions all starting with the code listed. Example: 2122.. (all item descriptions starting with 2122).
 Codes with .. in the middle indicate a group of item descriptions starting and ending with the codes listed. Example 2251..RS (all item descriptions starting with 2251 and ending with RS). **Information about item descriptions, printed in blue, is only available on our website: www.SystemPlastSmartGuide.com**

1. DEFINITIONS:

In these Terms and Conditions of Sale, "Seller" means System Plast S.r.l.; "Buyer" means the person, firm, company or corporation by whom the order is given; "Goods" means the goods (including any Software and Documentation, as defined in Clause 9) described in Seller's Acknowledgement of Order form; "Services" means the services described in Seller's Acknowledgement of Order Form; "Contract" means the written agreement (including these Terms and Conditions) made between Buyer and Seller for the supply of the Goods and/or provision of Services; "Contract Price" means the price payable to Seller by Buyer for the Goods and/or Services and "Seller Affiliate" means any company which is for the time being directly or indirectly controlled by the ultimate parent company of Seller. For the purposes of this definition, a company is directly controlled by or is a subsidiary of another company or companies which holds 50% or more of the shares carrying the right to vote at a general meeting of the first mentioned company and a particular company is indirectly controlled by another company or companies if a series of companies can be specified, beginning with that company or those companies and ending with the particular company, so related that each company in the series is directly controlled by one or more of the companies earlier in the series.

2. THE CONTRACT:

2.1 All orders must be in writing and are accepted subject to these Terms and Conditions of Sale. No terms or conditions put forward by Buyer and no representations, warranties, guarantees or other statements not contained in Seller's quotation or Acknowledgement of Order nor otherwise expressly agreed in writing by Seller shall be binding on Seller.

2.2 The Contract shall become effective only upon the date of acceptance of Buyer's order on Seller's Acknowledgement of Order form or upon the date of fulfilment of all conditions precedent stipulated in the Contract, whichever is the later (the "Effective Date"). If the details of the Goods or Services described in Seller's quotation differ from those set out in the Acknowledgement of Order Form the latter shall apply.

2.3 No alteration or variation to the Contract shall apply unless agreed in writing by both parties. However, Seller reserves the right to effect minor modifications and/or improvements to the Goods before delivery provided that the performance of the Goods is not adversely affected and that neither the Contract Price nor the delivery date is affected.

3. VALIDITY OF QUOTATION AND PRICES:

3.1 Unless previously withdrawn, Seller's quotation is open for acceptance within the period stated therein or, when no period is so stated, within thirty days after its date.

3.2 Prices are firm for delivery within the period stated in Seller's quotation and are exclusive of (a) Value Added Tax and (b) any similar and other taxes, duties, levies or other like charges arising outside Italy in connection with the performance of the Contract.

3.3 Prices (a) are for Goods delivered EXW (Ex works) Seller's shipping point, exclusive of freight, insurance and handling and (b) unless otherwise stated in the Seller's quotation, are exclusive of packing. If the Goods are to be packed, packing materials are non-returnable.

4. PAYMENT:

Payment shall be made: (a) in full without set-off, counterclaim or withholding of any kind (save where and to the extent that this cannot by law be excluded); and (b) in the currency of Seller's quotation within thirty days of date of invoice unless otherwise specified by Seller's Finance Department. Goods will be invoiced at any time after their readiness for despatch has been notified to Buyer. Services will be invoiced monthly in arrears or, if earlier, upon completion. Without prejudice to Seller's other rights, Seller reserves the right to: (i) charge interest on any overdue sums at Unicredit Banca d'Impresa S.p.A. Brescia, Italy (or such higher rate stipulated by applicable law) during the period of delay; (ii) suspend performance of the Contract (including withholding shipment) in the event that Buyer fails or in Seller's reasonable opinion it appears that Buyer is likely to fail to make payment when due under the Contract or any other contract; and (iii) at any time require such reasonable security for payment as Seller may deem reasonable.

5. DELIVERY PERIOD:

5.1 Unless otherwise stated in Seller's quotation, all periods stated for delivery or completion run from the Effective Date and are to be treated as estimates only not involving any contractual obligations.

5.2 If Seller is delayed in or prevented from performing any of its obligations under the Contract due to the acts or omissions of Buyer or its agents (including but not limited to failure to provide specifications and/or fully dimensioned working drawings and/or such other information as Seller reasonably requires to proceed expeditiously with its obligations under the Contract), the delivery/completion period and the Contract Price shall both be adjusted accordingly.

5.3 If delivery is delayed due to any act or omission of Buyer, or if having been notified that the Goods are ready for despatch, Buyer fails to take delivery or provide adequate shipping instructions, Seller shall be entitled to place the Goods into a suitable store at Buyer's expense. Upon placing the Goods into the store, delivery shall be deemed to be complete, risk in the Goods shall pass to Buyer and Buyer shall pay Seller accordingly.

6. FORCE MAJEURE:

6.1 The Contract (other than Buyer's obligation to pay all sums due to Seller in accordance with the Contract) shall be suspended, without liability, in the event and to the extent that its performance is prevented or delayed due to any circumstance beyond the reasonable control of the party affected, including but not limited to: Act of God,

war, armed conflict or terrorist attack, riot, fire, explosion, accident, flood, sabotage; governmental decisions or actions (including but not limited to prohibition of exports or re-exports or the failure to grant or the revocation of applicable export licenses), or labour trouble, strike, lockout or injunction. Seller shall have no obligation to supply any hardware, software, services or technology unless and until it has received any necessary licences or authorisations or has qualified for general licences or licence exceptions under applicable import, export control and sanctions laws, regulations, orders and requirements, as they may be amended from time to time (including without limitation those of the United States, the European Union and the jurisdiction in which Seller is established or from which the items are supplied). If for any reason any such licenses, authorisations or approvals are denied or revoked, or if there is a change in any such applicable laws, regulations, orders or requirements that would prohibit Seller from fulfilling the Contract, or would in the reasonable judgement of Seller otherwise expose Seller and/or Seller Affiliate(s) to a risk of liability under applicable laws, regulations, orders or requirements, Seller shall be relieved without liability of all obligations under the Contract.

6.2 If either party is delayed or prevented from performance of its obligations by reason of this Clause for more than 180 consecutive calendar days, either party may terminate the then unperformed portion of the Contract by notice in writing given to the other party, without liability provided that Buyer shall be obliged to pay the reasonable cost and expense of any work in progress and to pay for all Goods delivered and Services performed as at the date of termination. Seller may deliver by instalments and if so each delivery shall constitute a separate contract and failure by Seller to deliver any one or more of the instalments in accordance with their terms shall not entitle Buyer to terminate the whole Contract or treat it as repudiated.

7. INSPECTION, TESTING, AND CALIBRATION:

7.1 Goods will be inspected by Seller or manufacturer and, where practicable, submitted to Seller's or manufacturer's standard tests before despatch. Any additional tests or inspection (including inspection by Buyer or its representative, or tests in the presence of Buyer or its representative and/or calibration) or the supply of test certificates and/or detailed test results shall be subject to Seller's prior written agreement and Seller reserves the right to charge therefore; if Buyer or its representative fails to attend such tests, inspection and/or calibration after seven days' notice that the Goods are ready therefore, the tests, inspection and/or calibration will proceed and shall be deemed to have been made in the presence of Buyer or its representative and the Seller's statement that the Goods have passed such testing and/or inspection and/or have been calibrated shall be conclusive.

7.2 Claims for shortfalls in quantity or for incorrect delivery shall be void if made more than 14 days after delivery.

8. DELIVERY, RISK & TITLE:

8.1 Unless otherwise expressly stated in the Contract, the Goods will be delivered Carriage Paid To (CPT) the destination named in the Contract; freight, packing and handling will be charged at Seller's standard rates. Risk of loss of or damage to the Goods shall pass to Buyer upon delivery as aforesaid and Buyer shall be responsible for insurance of the Goods after risk has so passed. Alternatively, if it is expressly stated in the Contract that Seller is responsible for the insurance of the Goods after their delivery to the carrier, such insurance will be charged at Seller's standard rates. "Ex-works"; "FCA"; "CPT" and any other delivery terms used in the Contract shall be defined in accordance with the latest version of Incoterms.

8.2 Subject to Clause 8.1, title to the Goods shall pass to Buyer upon delivery.

9. DOCUMENTATION AND SOFTWARE:

9.1 Title to and ownership of the copyrights in software and/or firmware incorporated into or provided for use with the Goods ("Software") and documentation supplied with the Goods ("Documentation") shall remain with the relevant Seller Affiliate (or such other party as may have supplied the Software and/or Documentation to Seller) and is not transferred hereby to Buyer.

9.2 Except as otherwise provided herein, Buyer is hereby granted a non-exclusive, royalty-free licence to use the Software and Documentation in conjunction with the Goods, provided that and for so long as the Software and Documentation are not copied (unless expressly authorised by applicable law) and Buyer holds the Software and Documentation in strict confidence and does not disclose them to others, or permit others to have access to them (other than Seller's standard operating and maintenance manuals). Buyer may transfer the foregoing licence to another party which purchases, rents or leases the Goods, provided the other party accepts and agrees in writing to be bound by the conditions of this Clause 9.

9.3 Notwithstanding Sub-clause 9.2, Buyer's use of certain Software, (as specified by Seller and including but not limited to control system and AMS Software) shall be governed exclusively by the applicable Seller Affiliate or third party licence agreement.

9.4 Seller and Seller Affiliates shall retain ownership of all inventions, designs and processes made or evolved by them and save as set out in this Clause 9 no rights in intellectual property are hereby granted.

10. DEFECTS AFTER DELIVERY:

10.1 Seller warrants (i) subject to the other provisions of the Contract, good title to and the unencumbered use of the Goods; (ii) that Goods manufactured by Seller and/or Seller's Affiliates shall conform with Seller's specifications therefore and be free of defects in materials and workmanship and (iii) that Services provided by Seller or Seller Affiliates will be performed with all reasonable skill, care and due diligence and in accordance with good engineering practice. Seller will make good, by repair or at Seller's option by the supply of a replacement part or parts, any defects which, under proper use, care and maintenance, appear in Goods of Seller Affiliates' manufacture and which are reported to Seller within 12 calendar months from putting such Goods

into operation or 18 calendar months after their delivery, whichever period expires the sooner, (90 days after delivery in the case of Consumables and spare parts) (the "Warranty Period") and which arise solely from faulty materials or workmanship: provided always that defective items are returned to Seller at Buyer's cost carriage and insurance prepaid within the Warranty Period. ("Consumables" shall include glass electrodes, membranes, liquid junctions, electrolyte and O-rings). Replaced items shall become the property of the Seller. Repaired or replacement items will be delivered by Seller at Seller's cost to Buyer's mainland site in Italy or, if Buyer is located outside Italy, FCA in Italy. Seller will correct defects in Services provided by Seller or Seller Affiliates and reported to Seller within ninety days after completion of such Services. Goods or Services repaired, replaced or corrected in accordance with this Clause 10.1 shall be subject to the foregoing warranty for the unexpired portion of the Warranty Period or for ninety days from the date of their return to Buyer (or completion of correction in the case of Services), whichever expires the later.

10.2 Goods or Services sourced by Seller from a third party (not being a Seller Affiliate) for resale to Buyer shall carry only the warranty extended by the original manufacturer.

10.3 Notwithstanding Clauses 10.1 and 10.2, Seller shall not be liable for any defects caused by: fair wear and tear; materials or workmanship made, furnished or specified by Buyer; non-compliance with Seller's storage, installation, operation or environmental requirements; lack of proper maintenance; any modification or repair not previously authorised by Seller in writing; nor the use of non-authorized software or spare or replacement parts. Seller's costs incurred in investigating and rectifying such defects shall be paid by Buyer upon demand. Buyer shall at all times remain solely responsible for the adequacy and accuracy of all information supplied by it.

10.4 Subject to Clause 12, the foregoing constitutes Seller's sole warranty and Buyer's exclusive remedy for breach thereof. No representations, warranties or conditions of any kind, express or implied, shall apply as to satisfactory quality, merchantability, fitness for any particular purpose or any other matter with respect to any of the Goods or Services.

11. PATENT, ETC. INFRINGEMENT:

11.1 Subject to the limitations set forth in Clause 12, Seller shall indemnify Buyer in the event of any claim for infringement of Letters Patent, Registered Design, Design Right, Trade Mark or Copyright ("Intellectual Property Rights") existing at the date of formation of the Contract arising from the use or sale of the Goods, against all reasonable costs and damages awarded against Buyer in any action for such infringement, or for which Buyer may become liable in any such action, provided always that Seller shall not be liable to so indemnify Buyer in the event that:

(i) such infringement arises as a result of Seller having followed a design or instruction furnished or given by Buyer, or the Goods having been used in a manner or for a purpose or in a country not specified by or disclosed to Seller prior to the date of the Contract or in association or combination with any other equipment or software, or (ii) Seller has at its expense procured for Buyer the right to continue to use the Goods or has modified or replaced the Goods so that the Goods no longer infringe, or (iii) Buyer has failed to give Seller the earliest possible notice in writing of any claim made or to be made or of any action threatened or brought against Buyer and/or Buyer has failed to permit Seller, at Seller's expense, to conduct and control any litigation that may ensue and all negotiations for a settlement of the claim, or (iv) Buyer has made without Seller's prior written consent any admission which is or may be prejudicial to Seller in respect of any such claim or action, or (v) the Goods have been modified without Seller's prior written authorisation.

11.2 Buyer warrants that any design or instructions furnished or given by it shall not cause Seller to infringe any Intellectual Property Rights in the performance of Seller's obligations under the Contract and shall indemnify Seller against all reasonable costs and damages which Seller may incur as a result of any breach of such warranty.

12. LIMITATION OF LIABILITY:

Except for death or personal injury caused by Seller and for Seller's willful misconduct or gross negligence: (i) Seller's and Seller Affiliates' total liability for any and all damages, claims or causes of action howsoever arising (including, without limitation, damage, claims or causes of action by virtue of tort, by breach of contract or statutory duty, negligence, strict liability or infringement of Intellectual Property Rights) shall not exceed the Contract Price; and (ii) Seller and Seller Affiliates shall not be liable to Buyer in any circumstances for any loss of profits, loss of contracts, loss of use, loss of data or consequential or indirect loss nor, save as set out in Clause 11 and in the preceding provisions of this Clause, for any loss or damage of any kind whatsoever, howsoever arising, claimed against or suffered by Buyer.

13. STATUTORY AND OTHER REGULATIONS:

13.1 If Seller's obligations under the Contract shall be increased or reduced by reason of the making or amendment after the date of Seller's quotation of any law or any order, regulation or by-law having the force of law that shall affect the performance of Seller's obligations under the Contract, the Contract Price and delivery period shall be adjusted accordingly and/or performance of the Contract suspended or terminated, as appropriate.

13.2 Except to the extent otherwise required by applicable law, Seller shall have no responsibility for the collection, treatment, recovery or disposal of (i) the Goods or any part thereof when they are deemed by law to be 'waste' or (ii) any items for which the Goods or any part thereof are replacements. If Seller is required by applicable law, including waste electrical and electronic equipment legislation, in particular European Directives 2002/96/EC (WEEE) and 2003/108/EC as implemented by Legislative Decree dated July 25, 2005 no. 151, to dispose of 'waste' Goods or any part thereof, Buyer shall, unless prohibited by applicable law, pay Seller, in addition to the Contract Price, either (i) Seller's standard charge for disposing of such Goods or (ii) if Seller does not have such a standard charge, Seller's costs (including all handling, transportation and disposal costs and a reasonable mark-up for overhead) incurred in disposing of such Goods.

13.3 Buyer's personnel shall, whilst on Seller's premises, comply with Seller's applicable site regulations and Seller's reasonable instructions, including but not limited to those relating to safety, security and electrostatic discharge.

14. COMPLIANCE WITH LAWS

Buyer agrees that all applicable import, export control and sanctions laws, regulations, orders and requirements, as they may be amended from time to time, including without limitation those of the United States, the European Union and the jurisdictions in which Seller and Buyer are established or from which items may be supplied, and the requirements of any licenses, authorisations, general licences or licence exceptions relating thereto will apply to its receipt and use of hardware, software, services and technology. In no event shall Buyer use, transfer, release, export or re-export any such hardware, software or technology in violation of such applicable laws, regulations, orders or requirements or the requirements of any licences, authorisations or licence exceptions relating thereto. Buyer agrees furthermore that it shall not engage in any activity that would expose the Seller or any of its affiliates to a risk of penalties under laws and regulations of any relevant jurisdiction prohibiting improper payments, including but not limited to bribes, to officials of any government or of any agency, instrumentality or political subdivision thereof, to political parties or political party officials or candidates for public office, or to any employee of any customer or supplier. Buyer agrees to comply with all appropriate legal, ethical and compliance requirements.

15. DEFAULT, INSOLVENCY AND CANCELLATION:

Seller shall be entitled, without prejudice to any other rights it may have, to cancel the Contract forthwith, wholly or partly, by notice in writing to Buyer, if (a) Buyer is in default of any of its obligations under the Contract and fails, within 30 (thirty) days of the date of Seller's notification in writing of the existence of the default, either to rectify such default if it is reasonably capable of being rectified within such period or, if the default is not reasonably capable of being rectified within such period, to take action to remedy the default or (b) on the occurrence of an Insolvency Event in relation to Buyer. "Insolvency Event" in relation to Buyer means any of the following: (i) a meeting of creditors of Buyer being held or an arrangement or composition with or for the benefit of its creditors being proposed by or in relation to Buyer; (ii) a chargeholder, receiver, administrative receiver or similar person taking possession of or being appointed over or any distress, execution or other process being levied or enforced (and not being discharged within seven days) on the whole or a material part of the assets of Buyer; (iii) Buyer ceasing to carry on business or being unable to pay its debts; (iv) Buyer or its directors or the holder of a qualifying floating charge giving notice of their intention to appoint, or making an application to the court for the appointment of, an administrator; (v) a petition being presented (and not being discharged within 28 days) or a resolution being passed or an order being made for the administration or the winding-up, bankruptcy or dissolution of Buyer; or (vi) the happening in relation to Buyer of an event analogous to any of the above in any jurisdiction in which it is incorporated or resident or in which it carries on business or has assets. Seller shall be entitled to recover from Buyer or Buyer's representative all costs and damages incurred by Seller as a result of such cancellation, including a reasonable allowance for overheads and profit (including but not limited to loss of prospective profits and overheads).

16. SUPPLEMENTARY TERMS AND CONDITIONS:

If the Goods comprise or include a control system, Seller's Supplementary Terms and Conditions Applicable to the Supply of Control Systems and Related Services shall apply to the control system and related services only. Such Supplementary Terms and Conditions shall take precedence over these Standard Terms and Conditions of Sale; copies are available from Seller upon request

17. MISCELLANEOUS:

17.1 No waiver by either party with respect to any breach or default or of any right or remedy and no course of dealing, shall be deemed to constitute a continuing waiver of any other breach or default or of any other right or remedy, unless such waiver be expressed in writing and signed by the party to be bound.

17.2 If any clause, sub-clause or other provision of the Contract is invalid under any statute or rule of law, such provision, to that extent only, shall be deemed to be omitted without affecting the validity of the remainder of the Contract.

17.3 Buyer shall not be entitled to assign its rights or obligations hereunder without the prior written consent of Seller.

17.4 Seller enters into the Contract as principal. Buyer agrees to look only to Seller for due performance of the Contract.

17.5 GOODS AND SERVICES PROVIDED HEREUNDER ARE NOT SOLD OR INTENDED FOR USE IN ANY NUCLEAR OR NUCLEAR RELATED APPLICATIONS. Buyer (i) accepts Goods and Services in accordance with the foregoing restriction, (ii) agrees to communicate such restriction in writing to any and all subsequent purchasers or users and (iii) agrees to defend, indemnify and hold harmless Seller and Seller Affiliates from any and all claims, losses, liabilities, suits, judgements and damages, including incidental and consequential damages, arising from use of Goods and Services in any nuclear or nuclear related applications, whether the cause of action be based in tort, contract or otherwise, including allegations that the Seller's liability is based on negligence or strict liability.

17.6 The Contract shall in all respects be construed in accordance with the laws of Italy excluding, however, any effect on such laws of the 1980 Vienna Convention on Contracts for the International Sale of Goods, and to the fullest extent permitted by Law, shall be without regard to any conflict of laws or rules which might apply the laws of any other jurisdiction. All disputes arising out of the Contract shall be subject to the exclusive jurisdiction of the courts in Milan, Italy.

17.7 The headings to the Clauses and paragraphs of the Contract are for guidance only and shall not affect the interpretation thereof.

17.8 All notices and claims in connection with the Contract must be in writing.
